TECHNICAL DATA

Temperature Range: −40°C to +85°C.
Humidity test: Per EIA specifications RS 376
Capacitance tolerance: ±5%, ±10%, ±20%.
Rated voltage Vn: 100V-, 250V-, 400V-, 630V-, 1000V-.
Allowable a.c. voltage to 60 Hz: 63V~, 160V~, 200V~, 220V~, 250V~.
Dielectric loss tg at 20°C: $\leqslant 80\times10^{-4}$ at 1 kHz
$\leqslant 200\times10^{-4}$ at 10 kHz.
Inductance: <20nH measured at terminal length of 6mm.
Test voltage (2s): 1.6×Vn.

Insulation resistance at 20°C and 100V-:

$C \leqslant 0.33\mu F$	$C > 0.33\mu F$
$Vn \leqslant 100V$-	$Vn \leqslant 100V$-
$R = 15\times10^3\ M\Omega$	$R\times C = 5\times10^3 s$
$Vn > 100V$-	$Vn > 100V$-
$R = 30\times10^3\ M\Omega$	$RR\times C = 10^4 s$

The capacitors can be used to a temperature of 100°C, by which the working voltage at a temperature above 85°C is less than the rated voltage by 1.25% for every °C.

Important dielectric characteristics of plastic films:

Polyester = high dielectric strength
Polycarbonate = linear temperature curve
Polypropylene = extremely low losses (tan δ)

The figures in the tables of capacitances refer to the PCM = Printed Circuit Module (lead spacing) at the lead exit points

$E = \frac{1}{2}\ CV^2$

III. Linear charge of a capacitor (Amperes)

$I = C\frac{dV}{dt}$

IV. Total Impedance of a capacitor (ohms)

$Z = \sqrt{R_s^2 + (X_C - X_L)^2}$

Vacuum Capacitors

Jennings offers the broadest available line of high voltage capacitors for radio frequency applications. Units are available in glass and ceramic envelopes with working voltage ratings of 2 kv to 36 kv, at capacitance values to 5000 pfd, with current ranges tp 420 Amps RMS (air-cooled) and 1,000 Amps RMS (water-cooled), depending upon capacity, frequency, and working voltage. The design of Jennings Vacuum and Gas capacitors allows a number of electrical, mechanical and environmental advantages which include:

1) HIGH VOLTAGE — The high dielectric strength allows maximum voltage levels for a given capacitance rating.
2) HIGH CURRENT — Extremely low losses occur because of the dielectric, low loss glass and ceramic envelopes, and heavy copper construction. Jennings capacitors are able to handle large currents at high RF frequencies that would destroy other types of capacitors.
3) COMPACT DESIGN — Units are quite small for their power handling capabilities.
4) HIGH Maximum to Minimum CAPACITY RATIO — Capacity change ratios are available to 140:1, making them desirable for wide tuning ranges.
5) SELF-HEALING — The design construction permits moderate overloads that would damage other materials.
6) RUGGED OPERATION — Vacuum capacitors are free from internal degradation due to extreme environmental conditions.

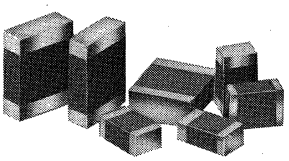
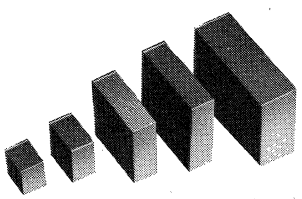
Ultra High Capacitance Chip Capacitors



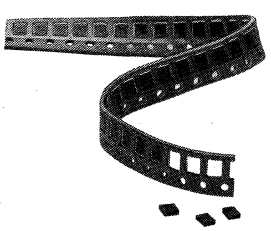
Fourteen configurations are available in four basic dielectrics: NPO/COG, BX/X7R, Z5U, and Y5V characteristics, to meet MIL-C-55681A and EIA 198B specifications. Capacitors feature high volume efficiency of capacitance, and are ideal for hybrid circuit applications.

High Voltage Chip Capacitors



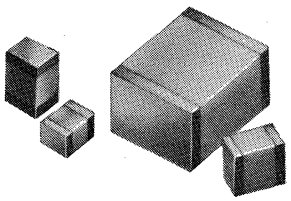
Available in either NPO/COG or BX/X7R dielectric, these units are designed to obtain high voltage values to 4000 VDCW. Typical applications include high voltage power supplies and voltage multiplier circuits.

Multilayer Ceramic Chip Capacitors on Tape & Reel



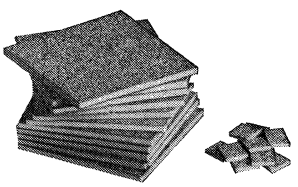
Ceramic chip capacitors designed for automatic placement on ceramic substrates on printed circuit boards in high volume surface mounted applications. Offered in three sizes R15, R18 and S41 they are suited for use with all the popular automatic placement systems. Available in 8mm tape on reel. Larger size units can be provided on 12mm tape on reel.

High Q Microwave Chip Capacitors



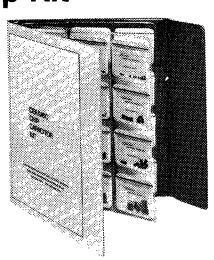
High Q microwave chip capacitors are available in four basic sizes, displaying excellent performance in the VHF, UHF and microwave ranges. The configuration, insertion loss and resonance-free performance make these chips ideal for microstrip and hybrid MIC applications.

Ceramic Capacitor Wafers (Single Layer)



Ideally suited for micromodule and miniature hybrid integrated circuits where low profile requirements preclude the use of conventional multilayer chip capacitors. These units are used as bypass, coupling and filtering elements, (to 18GHz in microwave applications). Custom configurations are also available for high voltage applications to 15 KV.

Chip Kit



Designer kits contain standard size chips in popular capacitance values and dielectric characteristics with palladium silver terminations. Kits are supplied in a special vinyl cover for convenient shelf storage with each chip value individually packaged for easy acesss. Available with NPO/COG dielectric No. S-900, BX/X7R and Y5V dielectric No. S-905 ceramic capacitor wafers (single layer) No. S-910 and High Q S-915.

Ultra-Q Miniature Microwave Ceramic Capacitors QUALIFIED TO MIL-C-55681B

A state of the art ceramic capacitor designed for use at microwave frequencies. The superior dielectric properties of the ceramic material furnish extremely high Q and lowest loss of any type capacitor available. A minimum Q of 10,000 is guaranteed at 1 MHz. Units are available in either chip form or various leaded configurations. Typical applications include low noise FET circuits, high frequency, low noise receiver front ends and UHF microwave hybrids.

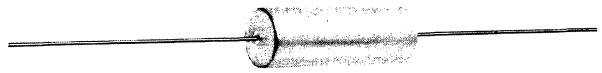
TYPE 107 POLYESTER FILM CAPACITORS

POLYESTER FILM CAPACITORS EXTENDED FOIL/FILM WRAP/EPOXY END FILL STYLE 107 −55°C TO +125°C



ELECTRICAL AND ENVIRONMENTAL CHARACTERISTICS

CAPACITANCE MEASUREMENTS

Capacitors of 1.0 μF or less shall be measured at a frequency of 1000 Hz. Capacitors greater than 1.0 μF shall be measured at 60 Hz. The standard capacitance tolerance is 20%. Other tolerances are available upon request.

Reference: MIL-STD-202, Method 305.

TEMPERATURE CHARACTERISTICS

The maximum change in capacitance from the measured value at +25°C shall be −6% at −55°C, and +15% at +125°C.

DISSIPATION FACTOR

When measured as specified in Paragraph 1, the dissipation factor at +25°C shall not exceed 0.6% for values up to 1.0 μF and shall not exceed 1.0% for greater capacitance values.

INSULATION RESISTANCE

When measured at +25°C, and rated voltage (or 500 VDC, whichever is less), the insulation resistance shall be a minimum of 50,000 megohm-microfarads, but need not exceed 100,000 megohms. The period of electrification shall not exceed two minutes.

Reference: MIL-STD-202, Method 302.

VOLTAGE DERATING

The capacitors may be operated at full rated voltage from −55°C to +85°C, or with linear derating to 50% of rated voltage above +85°C with a maximum temperature of +125°C.

VOLTAGE TEST

When tested at +25°C, the capacitors shall withstand the indicated DC test voltages for a period of one minute:

Terminal to terminal	200% of DC rating
Terminal to case (less than .235 diameter)	200% of DC rating
Terminal to case (greater than .235 diameter)	400% of DC rating or 2,000 VDC, whichever is less

Reference: MIL-STD-202, Method 301.

LIFE TESTING

When tested for 1000 hours at 150% of the appropriate rated voltage for the test temperature, the capacitors shall exhibit no more than one failure in twelve pieces tested. Alternatively, an accelerated +125°C test may be performed at the +85°C voltage rating for a period of 250 hours. A failure is defined as:

a) A capacitance change of more than 10% of its initial value;
b) A dissipation factor greater than that specified in Paragraph 3;
c) An insulation resistance less than ⅓ that specified in Paragraph 4; or
d) A permanent open or short.

VIBRATION

The capacitors will meet or exceed in the vibration requirements of MIL-STD-202, Method 201.

TYPE 188 POLYESTER CAPACITORS

METALLIZED POLYESTER CAPACITORS TYPE 188 FILM WRAP / EPOXY END FILL −55°C TO +125°C

Type 188 Capacitors features extremely small size, light weight and self clearing metallized construction which virtually eliminates catastrophic failures. Well suited for Voltage Multiplier Circuits in TV power supplies and Electrostatic copiers. Also ideal for Potting or encapsulating in Electronic Sub assemblies, Power supplies, etc.

CAPACITANCE
Measurements shall be made at 1000 cycles per second for capacitance values thru 1. MFD and at 60 cycles per second for values over 1. MFD.

CAPACITANCE TOLERANCE
Standard capacitance tolerance is ±20% (M). Closer tolerances available upon request.

DISSIPATION FACTOR
The dissipation factor shall not exceed 1% when measured at 25°C. Measurements shall be made at 1000 Hz for capacitance values thru 1. MF and at 60 Hz for higher values.

TEST VOLTAGE
Capacitors shall withstand 200% of rated DC voltage for one minute at 25°, with the charging and discharge current limited to a maximum of 1. Ampere.

OPERATING TEMPERATURES
−55°C to +125°C.

LIFE TEST
Capacitors shall withstand a life test of 250 hours at 125°C, with 140% of the 125°C rated DC voltage applied. A resistance of one ohm per volt of applied voltage shall be inserted in series with the capacitor.

VOLTAGE DERATING
These capacitors will operate as full DC voltage ratings at 85°C. For operation at temperatures above 85°C, see Figure 4.

VIBRATION
Capacitors shall withstand a vibration test per Method 204, Test condition B of MIL-STD-202B as modified by MIL-C-27287. After test, the I.R. will be equal to or greater than ⅓ of the initial requirement.

HUMIDITY TEST
These capacitors shall meet the humidity test requirements of MIL-STD-202 Method 103B, test condition B. After testing the I.R. will be equal to or greater than ⅓ of the initial requirement.

TYPE 189 POLYESTER CAPACITORS

METALLIZED POLYESTER CAPACITORS TYPE 189 FILM WRAP / EPOXY END FILL −55°C TO +125°C

Type 189 Capacitors features extremely small size, light weight and self clearing metallized construction which virtually eliminates catastrophic failures. Well suited for Voltage Multiplier Circuits in TV power supplies and Electrostatic copiers. Also ideal for Potting or encapsulating in Electronic Sub assemblies, Power supplies, etc.

CAPACITANCE
Measurements shall be made at 1000 cycles per second for capacitance values thru 1. MFD and at 60 cycles per second for values over 1. MFD.

CAPACITANCE TOLERANCE
Standard capacitance tolerance is ±20% (M). Closer tolerances available upon request.

DISSIPATION FACTOR
The dissipation factor shall not exceed 1% when measured at 25°C. Measurements shall be made at 1000 Hz for capacitance values thru 1. MF and at 60 Hz for higher values.

TEST VOLTAGE
Capacitors shall withstand 200% of rated DC voltage for one minute at 25°, with the charging and discharge current limited to a maximum of 1. Ampere.

OPERATING TEMPERATURES
−55°C to +125°C.

LIFE TEST
Capacitors shall withstand a life test of 250 hours at 125°C, with 140% of the 125°C rated DC voltage applied. A resistance of one ohm per volt of applied voltage shall be inserted in series with the capacitor.

VOLTAGE DERATING
These capacitors will operate as full DC voltage ratings at 85°C. For operation at temperatures above 85°C, see Figure 4.

VIBRATION
Capacitors shall withstand a vibration test per Method 204, Test condition B of MIL-STD-202B as modified by MIL-C-27287.

HUMIDITY TEST
These capacitors shall meet the humidity test requirements of MIL-STD-202 Method 103B, test condition B. After testing the I.R. will be equal to or greater than ⅓ of the initial requirement.

TYPE 231 POLYSTYRENE FILM CAPACITORS

POLYSTYRENE FILM CAPACITORS HERMETICALLY SEALED TYPE 231 —65°C to +85°C

ELECTRICAL AND ENVIRONMENTAL CHARACTERISTICS

1. CAPACITANCE MEASUREMENTS

Capacitors of 1.0 μF or less shall be measured at a frequency of 1000 Hz. Capacitors greater than 1.0 μF measured at 60 Hz.
Tolerances of ±20%, ±10%, ±5%, ±2%, ±1% are standard. Tolerances closer than ±1% are available upon request.
Reference: MIL-STD-202, Method 305.

2. TEMPERATURE/CHARACTERISTICS AND STABILITY

When measured over the full operating range, the Temperature Coefficient shall be −120 ppm/°C ±30 ppm/°C.
There shall be less than 0.1% change per year in capacitance when operated between +20°C and +50°C. When cycled from −55°C to +75°C, the capacitance shall not vary more than 0.2% from its initial measurement.

3. DISSIPATION FACTOR

When measured as specified in Paragraph 1, the dissipation factor at +25°C shall not exceed 0.1%.

4. INSULATION RESISTANCE

When measured at +25°C, and rated voltage (or 500 VDC, whichever is less), the insulation resistance shall be a minimum of 200,000 megohm-microfarads, but need not exceed 500,000 megohms. The period of electrification shall not exceed two minutes.
Reference: MIL-STD-202, Method 302.

5. VOLTAGE DERATING

The capacitors may be operated at full rated voltage from −55°C to +85°C.

6. VOLTAGE TEST

When tested at +25°C, the capacitors shall withstand the indicated DC test voltages for a period of one minute:
Terminal to terminal 200% of DC rating
Terminal to case 200% of DC rating
Reference: MIL-STD-202, Method 301.

7. LIFE TESTING

When tested at 85°C for 250 hours at 140% of the rated voltage, the capacitors shall exhibit no more than one failure in twelve pieces tested. A failure is defined as:
a) A capacitance change of more than 6% of its initial value;
b) A dissipation factor greater than that specified in Paragraph 3;
c) An insulation resistance less than 60% that specified in Paragraph 4; or
d) A permanent open or short.

8. VIBRATION

The capacitors will meet or exceed the vibration requirements of MIL-STD-202, METHOD 201.

PEC 831 Metallized Polyester Film

General Characteristics

The PEC 831 is manufactured using a unique packaging process which allows the production of a compact body size for a given capacitance. This allows the designer to specify an automatically insertable, axial lead capacitor allowing higher circuit board densities than were previously possible. The general characteristics of the PEC 831 make it an ideal choice for general coupling, decoupling and filtering applications. All PPD capacitors are made in the U.S. and are available taped and reeled for automatic insertion.

PPC 830 Polypropylene Film/Foil

General Characteristics.

The PPC 830 is an axial lead, polypropylene film capacitor that features small size, low price and flame retardant coating. The electrical stability of polypropylene and its characteristic high resistance to moisture allow these units to retain their original capacitance over long periods of time without degradation due to changing environmental conditions. The PPC 830 has the excellent characteristics previously found only in polystyrene capacitors but offers a higher temperature rating and, of course, flame resistance. The low negative TC and very low dissipation factor of the PPC 830 provide for a stable frequency response curve and high Q in resonant and filtering circuit applications. Since the PPC 830 also exhibits high insulation resistance (I.R.) and low dielectric absorption (D.A.), it is a good choice for storage and timing circuit applications. All PPD capacitors are made in the U.S. and are available taped and reeled for automatic insertion.

PPC 831 Metallized Polypropylene Film

General Characteristics

The PPC 831 is an axial lead, metallized polypropylene film capacitor featuring small size, high performance, low price and conformal encapsulation with a flame retardant coating.

The physical and electrical characteristics of polypropylene as a dielectric are commendable. Polypropylene is relatively impervious to moisture. It is also extremely stable. The PPC 831 will, therefore, retain its original properties over extended periods of time in a fluctuating environment.

Other noteworthy attributes of the PPC 831 are high insulation resistance (IR) and a low dielectric absorption (DA) factor. Both of these parameters are of critical importance in the selection of a sample-and-hold capacitor in data acquisition applications. The DA of polypropylene is about 10 times less than that of polyester and is significantly less than that of polycarbonate or polystyrene.

Also to be considered are the gently sloping curves for temperature coefficient (TC), dissipation factor (DF) and capacitance variation with frequency. The relatively flat response of the PPC 831 assures dependable, stable performance when incorporated into critical resonant and filtering circuit applications.

The "A" and "B" case sizes of the PPC 831 and PEC 831 style capacitors are computer designed with today's manufacturing and design criteria firmly in mind — namely, automation.

Until now, the most useful configuration for automated assembly, with respect to general bypassing, filtering and timing requirements, has been the box style capacitor. This is because the corresponding axial style devices are of physical proportions incompatible with automatic insertion equipment. Unfortunately, the box capacitor presents the modern factory with its own unique problems. An expensive radial insertion machine must be obtained. Box insertion requires an additional step in the assembly process which adds both direct and indirect production costs. In comparison, axials insert 3 times faster than radials.

PPD has been studying this situation for some time now. The culmination of this work has been the development of the "A" and "B" case film capacitors. The designer is now presented with the capability of specifying axial lead, automatically insertable, metallized film capacitors in the range of .001 μF to .27 μF. Examination of the dimensions of the "A" and "B" cases will reveal that, in length, they closely approximate the dimensions of RN55 and RN60 style resistors. Both "A" and "B" cases have a .177" ± .020" diameter. They can, therefore, be taped on 0.2" centers. Ultimately, these devices can be sequenced on standard axial lead insertion machinery to provide high volume, low cost production.

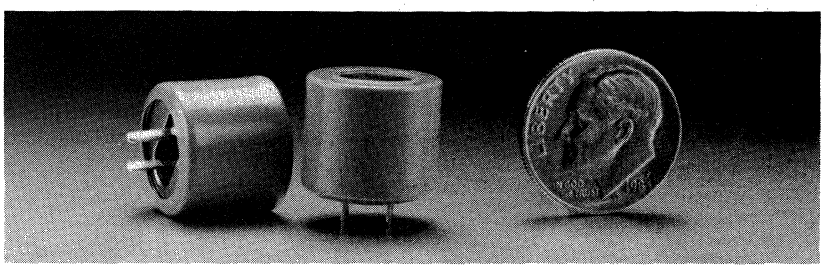
Maxcap™ Double Layer Capacitor

New High Energy Storage Device



The ideal backup power source for microprocessors and memories. Maxcap DLC, the high-energy power source you never have to replace.

Maxcap Double Layer Capacitors (DLCs) combine extremely long life with many of the desirable electrical characteristics of traditional capacitors (such as rapid and frequent discharge/recharge capability), with energy densities and low leakage currents which approach those of batteries. One farad can be stored in a 1.1" x 0.6" package. Maxcap DLCs are ideal for providing the needed backup power for volatile semiconductor memories.

Conventional energy storage devices such as batteries and aluminum electrolytic capacitors must be replaced during the life of a product. Maxcap DLCs never need replacing because, unlike batteries, they do not undergo life limiting, irreversible chemical reactions, and unlike aluminum electrolytic capacitors, they do not experience dry-up problems.

Product Features

Very high capacity in small size. Circuit board space and equipment size can be reduced.

Ultra long life. Maxcap DLCs have no parasitic chemical reactions, no dry-up problems, and can be fully charged and discharged indefinitely.

Maintenance free. Maxcap DLCs can be placed in sealed or remote locations because they require no access ports. Warranty claims are minimized.

Five-volt output. Maxcap DLCs are ideally suited for powering integrated circuits in all types of equipment. Additional voltages are available.

Wide operating temperature range. -25°C to +70°C (-13°F to 158°F).

Long shelf life. Tests indicate performance is the same after ten years in storage.

Nonpolar. Assembly errors and costs are minimized.

Simple, low cost circuitry. Since Maxcap DLCs do not require current limiting resistors or special over-voltage protection, design and assembly times are reduced.

Safer than batteries. These capacitors will not explode or be damaged if short circuited. They can be installed with wave soldering equipment.

Comparison with Batteries

When the energy of a battery is not needed, Maxcap DLCs have many attributes which make them the best solution to your backup requirements.

State of Charge. Unlike batteries, the charge state of Maxcap DLCs can be easily determined by measuring the voltage.

Simple Circuit. Unlike battery backup circuits, special current limiting charge resistors and over-voltage protection are not required with Maxcap DLCs. You save design time, assembly material and labor costs.

Installation/Assembly. Because Maxcap DLCs are non-polar, they can be inserted into electrical systems without creating reverse connection errors. Unlike batteries, they can be short circuited or have reverse current applied without damage or explosion. These features allow more freedom in using high speed assembly methods such as wave soldering.

Equipment Design Flexibility. The unlimited cycle life and long life characteristics of Maxcap DLCs assure greater freedom in selecting their location in your product since access ports do not have to be provided for replacement. This feature, along with their small size, can result in a smaller end product and reduced usage of expensive printed circuit board space.

Product Value/Pricing. Since your product will not require battery replacement, reduced maintenance costs, smaller size, and higher reliability can result in higher profits.

Warranty costs. Your product will not have to be opened to replace batteries; warranty costs may be reduced.

GET ORGANIZED!

Are your catalog files organized? Can you find any given catalog in a matter of seconds? If your answer is "Yes," you probably already have the EEM File System. But, if you said "No," you really ought to look into this simple system. It will save hours of time and tons of aggravation.

The EEM File System was invented over twenty-five years ago to help people who specify, buy, or work with electronic products and equipment. It is upgraded on a constant basis to reflect the current state of the art. It's easy to use and easy to customize to your particular needs.

You say you want to file catalogs by type of product? That's easy to do with The System. But, what are you going to do when there are multiple products in one catalog? Take Mallory for example. There are all kinds of products in the Mallory Short Form Catalog. With the EEM File System all you do is file the catalog under "M" for Mallory and refer to it on all of the cross reference cards that apply.

There are thousands of EEM File Systems in everyday use in engineering and procurement offices all over the world. Shouldn't you be using this proven system?

The EEM File System is shipped in one neat package. The package contains everything you need to set up your very own filing system. Best of all, it's easy to get and very affordable. Send a check or money order for $25.00 and EEM will pay the postage and sales tax. If you must use a purchase order, please add $5.00 for postage and handling. An invoice will accompany your System.

Don't waste any more time. Get organized now!

Metallized Polyester

Type X663F and X663FR

- **Axial or Radial Leads**
- **Ultra-miniature, Lightweight**
- **High Insulation Resistance**
- **Instrument Quality**
- **Self-healing • Long Stable Life**

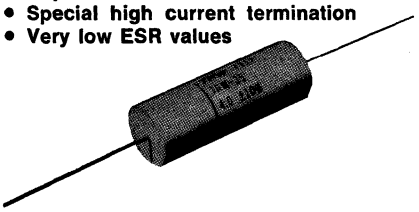
Metallized Polypropylene Dielectric

Type TRW-35

- **Designed for switching power supply applications**
- **Rated for 20 KHz usage**
- **High current — up to 9A rms**
- **Capacitance to 30 mfd**
- **Special high current termination**
- **Very low ESR values**



PERFORMANCE

The TRW-35 is designed specifically for switching power supply applications where high current, high capacitance range and low ESR values are important.

The Metallized polypropylene TRW-35 shows negligible shift in capacitance under long term exposure to humidity, operating life and temperature cycling. Insulation resistance, dielectric absorption and dissipation factor properties are all superior to those of electrolytic capacitors presently used by switching power supply manufacturers. Added to these features are size and weight savings.

APPLICATIONS

The TRW-35 is used for input filtering, hi-frequency transformer D.C. blocking, and output filtering. As an input filter it provides EMI protection back into the line (generated by the switch) and serves as a quasi-constant current source (turn on for the switch). As a D.C. blocking capacitor it prevents D.C. saturation of the hi-frequency transformer caused by switch unbalance while passing the AC square wave with little loss. As an output filter it provides a low impedance path for high frequency ripple filtering.

Unlike the electrolytic capacitor often used for such applications, the TRW-35 exhibits little or no capacitance roll-off with increasing frequency. The TRW-35 features ESR typically an order of magnitude or more under the ESR of equivalent electrolytic capacitance values.

In filter designs where capacitance values of 30 mfd or smaller are adequate for system performance, the TRW-35 offers impedance characteristics that can significantly enhance the overall system design.

- **High current — up to 4A rms**
- **Capacitance to 4.7 mfd**
- **White polyester tape wrap case**

PERFORMANCE

The TRW-61 is designed specifically for switching power supply applications where current and low ESR Values are important. The metallized polyester TRW-61 shows negligible shift in capacitance under long exposure to humidity, operating life and temperature cycling. Insulation resistance, dielectric absorption and dissipation factor properties are all superior to those of electrolytic capacitors presently used by switching power supply manufacturers.

These features, plus size and weight savings in SPS designs, make the TRW-61 the logical capacitor for performance and design of switching power supplies requiring medium current ratings.

Type TRW-39A

- **Resistor: 3.9 ohm ½ watt ±10% carbon composition**
- **Capacitor: 0.1 mfd ±20%, 50 VDC**
- **White polyester tape wrap case**
- **Low inductance, extended foil construction**
- **Rugged polyester-foil design**

PERFORMANCE

This rugged RC network is designed for snubber applications across Schottky diodes operating in 20 KHz switching power supplies and provides critical damping of the ringing encountered in many circuits.

APPLICATIONS

Specifically designed for applications in 20 KHz switching power supplies, the TRW-39A provides critical damping and reverse voltage protection for the Schottky diode. The leakage inductance of the high frequency power transformer causes ringing of the reverse voltage when diode conduction abruptly ceases. This can cause Schottky diode failure. Figure 1 shows the snubber used across each diode. For other RC values contact TRW Capacitors, Application Engineer.

Applications and Features

TUSONIX WEECON Plate Ceramic Capacitors offer the broadest selection of ceramic formulations and package sizes available. Capacitance values range from 1 pF through .082Mfd; a variety of TC materials and tolerances is available. The range of temperature characteristics adapts these capacitors from the ultra stable requirements of tuned circuits to the general purpose needs for coupling and by-pass applications. Voltages are from 25V to 500V. (For complete details, consult our WEECON® Ceramic Capacitor catalog.)

Physical Characteristics

Weecon **Temperature Compensating** Ceramic Capacitors are ideal for applications demanding precisely controlled capacitance changes with temperature variation. They are well suited for high Q circuits requiring optimum frequency stability and have excellent retrace characteristics. **Extended Temperature Compensating** Weecons are indicated where large controlled capacitance change with temperature variation is a factor. For applications where volumetric efficiency is of prime importance, **Stable** Weecons will provide higher capacitance values, in smaller packages with better reliability. TUSONIX **General Purpose** Weecons are ideal for circuits requiring the utmost in volumetric efficiency at rated temperatures.

Ceramic Capacitors—Trimmers

TUSONIX leads the way in the miniaturization of trimmers, or variable ceramic capacitors. Developments such as those illustrated below have established TUSONIX as a leader in the state of the art. More than 30 years of experience in Trimmer design and technology have enabled TUSONIX to offer engineers the world's most complete line of ceramic trimmer capacitors.

During the past 10 years the ceramic trimmer capacitor has become the most popular trimmer in the electronics industry. The inherent reliability, small size, low cost and wide selection of available electrical characteristics are major factors in the ceramic capacitor's continuing popularity among design engineers.

TUSONIX produces a broad range of fixed and variable (trimmer) ceramic capacitors. Complete research, development and manufacturing of the ceramic dielectric itself and the finished capacitor is performed by TUSONIX. Today TUSONIX is recognized as one of the world's leading suppliers of quality ceramic capacitors.

Ceramic Capacitors—High Voltage

High Voltage Ceramic Capacitors have been one of Tusonix outstanding component capabilities for many years. These high quality components are used in a broad variety of applications: electric utility transformers, power supplies and voltage multipliers for CRT displays, navigation equipment, electro-optic equipment and image intensifiers for night vision apparatus.

Recent material and design development have allowed Tusonix to dramatically reduce size in many instances, with improved % D.F., IR, TC and DC/TC characteristics. Best of all, the Tusonix high quality standards remain intact.

Ceramic Capacitors—Disc

Applications and Features

TUSONIX Ceramic Disc Capacitors offer high performance in a complete range of ratings, values, and sizes. The complete line of voltage ratings offers the designer the convenience of selecting the exact capacitor rating required for his application. TUSONIX Discs are available in 100-200-500 VDC; 1-2-3-4-5 and 6 KV. Capacity increases per size for voltages less than 500 volts and decreases per size for voltages greater than 500 volts. Where voltage rating is not critical, we recommend our standard 500 volt line. (For complete details, consult our Ceramic Disc Capacitor catalog.)

General Electrical Specifications

Ceramic Disc Capacitors are available in a broad range of dielectric constants. This allows a wide selection of capacitance values.

Temperature Compensating

Ceramic Capacitors (NPO Thru N750) are ideal for applications requiring very precisely controlled capacitance change with temperature, high Q and very small capacitance tolerance.

Extended Temperature Compensating

Disc Capacitors (N1000 thru N5600) are capacity sensitive to temperature in varying degrees, and are useful as temperature compensating elements for stabilization over a wide temperature range.

General Purpose or Hi-K Specials

Special disc products are available from TUSONIX upon request, including details on TUSONIX's approval for U.L. line by-pass capacitors and approval to Mil-C-20 and Mil-C-11015.

Physical Characteristics

Leads—All values up to and including 2 KV are available with 20, 22 and 24 AWG leads, except body sizes. 655" max. and larger available with 20 or 22 AWG only. All values up to and including 6 KV are available with 20 or 22 AWG leads.

Body insulation—conformal coating.

Standard max. coating on leads is .125"; closer control is optional at extra cost.

Marking—Trademark, Cap, Tol., T.C., and Voltage (Voltage omitted on 500V).

TUSONIX also offers inside kink leads, outside kink leads and short pin leads to the electronic industry for use in printed wiring board applications.

Special physical requirements are also available. Special lead spacing requirements are optional upon request, in addition to standard nominal lead spacings.

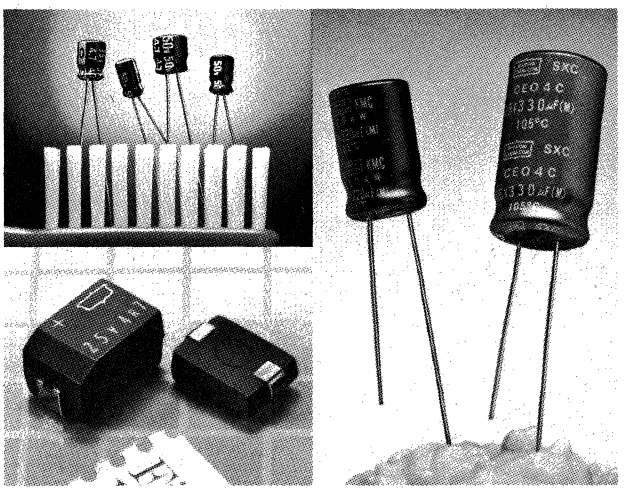
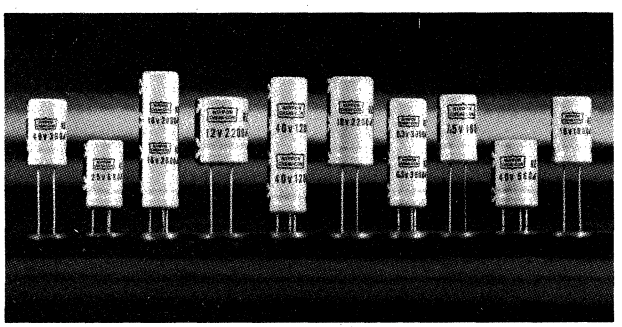
UNITED CHEMI-CON

The LEADER in Aluminum Electrolytic Capacitors for over 50 Years. Today, More Popular Than Ever!

Wider Product Range

The latest technology enables United Chemi-Con to offer a wider choice of capacitors than ever before. High gain foil increases our capacitors' volumetric efficiency. We can build smaller and smaller capacitors without diminishing performance. We also are designing more capacitors that meet special needs, such as low leakage current, without sacrificing other electrical characteristics. And our expanding series of solvent-proof capacitors can be inserted on PC boards along with other components before soldering and cleaning with halogenated solvents. Whatever your needs, we have the capacitors to meet them.





Expanded Facilities

In 1983 United Chemi-Con opened a new 54,000 square foot warehouse in Compton, California. The most advanced computer systems link this warehouse with our Corporate Headquarters in Rosemont, Illinois. In 1984 we opened a Western Region Branch Sales Office in Compton. It provides full-scale services to our Western customers.

Engineering & Technical Support

A team of applications engineers at Corporate Headquarters answers engineering questions, cross-references parts and reviews drawings. They are readily accessible to our customers by telephone. Our product data sheets, newsletters and catalogs set the standard for the industry. Send for our 256-page *Full Line Catalog* detailing the widest variety of aluminum electrolytic capacitors available from any one manufacturer *in the world.*

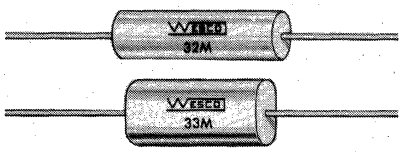
WESCO® POLYESTER FILM-FOIL CAPACITORS



SPECIFICATIONS

DIELECTRIC WITHSTANDING VOLTAGE

200% of rated voltage applied through a minimum limiting resistance of 100 Ohms/Volt. Duration of voltage stress shall be 15 seconds minimum and 1 minute maximum at 25°C.

TEMPERATURE RANGE

−55°C to +85°C with full rated voltage applied. To +125°C with 50% of rated voltage.

INSULATION RESISTANCE

At 25°C after 2 minutes of electrification at rated voltage or 500 VDC, whichever is less, the minimum product of Insulation Resistance and Capacitance shall be 100,000 megohms-microfarads, but need not exceed 100,000 megohms.

DISSIPATION FACTOR

Shall not exceed 0.75% when measured at 25°C and 1000 Hz, ±20 Hz. See characteristic curves for D.F. ratings at other temperatures.

CAPACITANCE AND TOLERANCE

Shall be measured within the tolerance limits specified. Measurements will be made at 25°C and 1000 Hz ±20 Hz.

LIFE TEST

Shall withstand 140% of rated voltage at 85°C for 250 hours. One failure in twelve shall be permitted.

CAPACITANCE STABILITY (DRIFT)

Less than 0.50% when measured in the following manner: three capacitance readings at 25°C, each made prior to and after temperature cycling from room to 80°C, and room to −55°C. The mathematical difference between the two extremes, divided by the intermediate value, and then multiplied by 100, yields the stability expressed in percent.

HUMIDITY RESISTANCE

Meets requirements of Mil-C-27287,, Para. 3.12 when tested in accordance with Mil-STD.-202C, Method 103 B, Condition B.

LEAD PULL AND BEND TEST

Steady pull of 5 pounds applied axially to leads for one minute. Bend test shall consist of one bend from the point of egress, first 90° in one direction, back to the original axial position, and then 90° in the opposite direction with no evidence of breakage.

FEATURES

Wrap and fill construction.

Tubular or oval configuration for optimum space savings.

Extended foil design.

Quality control procedures per Mil-Q-9858.

Will meet or exceed Mil-C-27287.

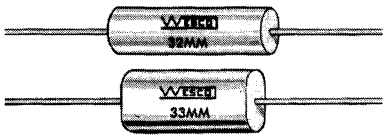
WESCO® METALIZED POLYESTER CAPACITORS



SPECIFICATIONS

DIELECTRIC WITHSTANDING VOLTAGE

200% of rated voltage applied through a minimum limiting resistance of 100 Ohms/Volt. Duration of voltage stress shall be 15 seconds minimum and 1 minute maximum at 25°C.

TEMPERATURE RANGE

−55°C to +85°C with full rated voltage applied. To +125°C with 50% of rated voltage.

INSULATION RESISTANCE

At 25°C after 2 minutes of electrification at rated voltage or 500 VDC, whichever is less, the minimum product of Insulation Resistance and Capacitance shall be 30,000 megohms-microfarads, but need not exceed 30,000 megohms.

DISSIPATION FACTOR

Shall not exceed 1.0% when measured at 25°C and 1000 Hz, ±20 Hz. See characteristic curves for D.F. ratings at other temperatures.

CAPACITANCE AND TOLERANCE

Shall be measured within the tolerance limits specified. Measurements will be made at 25°C and 1000 Hz, ±20 Hz.

LIFE TEST

Shall withstand 140% of rated voltage at 85°C for 250 hours. One failure in twelve shall be permitted.

CAPACITANCE STABILITY (DRIFT)

Less than 0.3% when measured in the following manner: three capacitance readings at 25°C, each made prior to and after temperature cycling from room to 85°C, and room to −55°C. The mathematical difference between the two extremes, divided by the intermediate value, and then multiplied by 100, yields the stability expressed in percent.

HUMIDITY RESISTANCE

Meets requirements of Mil-C-27287, Para. 3.12 when tested in accordance with Mil-STD.-202C, Method 103 B, Condition B.

LEAD PULL AND BEND TEST

Steady pull of 5 pounds applied axially to leads for one minute. Bend test shall consist of one bend from the point of egress, first 90° in one direction, back to the original axial position, and then 90° in the opposite direction with no evidence of breakage.

FEATURES

Wrap and fill construction
Tubular and oval configuration for optimum space savings
Extended foil design
Miniature size — lightweight
Low dissipation factor
Excellent stability
Quality control procedures per Mil-Q-9858

WESCO POLYSTYRENE CAPACITORS

SPECIFICATIONS

DIELECTRIC WITHSTANDING VOLTAGE
200% of rated voltage applied through a minimum limiting resistance of 100 Ohms/Volt. Duration of voltage stress shall be 15 seconds minimum and 1 minute maximum at 25°C.

INSULATION RESISTANCE
At 25°C after 2 minutes of electrification at rated voltage or 500 VDC, whichever is less, the minimum product of Insulation Resistance and Capacitance shall be 500,000 megohms-microfarads, but need not exceed 500,000 megohms.

DISSIPATION FACTOR
Shall not exceed .05% when measured at 25°C and 1000 Hz, ± Hz. See characteristic curves for D.F. ratings at other temperatures.

CAPACITANCE AND TOLERANCE
Shall be measured within the tolerance limits specified. Measurements will be made at 25°C and 1000 Hz, ±20 Hz.

LIFE TEST
Shall withstand 140% of rated voltage at 85°C for 250 hours. One failure in twelve shall be permitted.

TEMPERATURE COEFFICIENT
Capacitance shall change linearly over operating temperature range at rate of −105, ±30 parts per million/°C.

CAPACITANCE STABILITY (DRIFT)
Less than .05% when measured in the following manner: three capacitance readings at 25°C, each made prior to and after temperature cycling from room to 85°C, and room to −55°C. The mathematical difference between the two extremes, divided by the intermediate value, and then multiplied by 100, yields the stability expressed in percent.

HUMIDITY RESISTANCE
Meets requirements of Mil-C-27287, Para. 3.12 when tested in accordance with Mil-STD.-202C, Method 103 B, Condition B.

LEAD PULL AND BEND TEST
Steady pull of 5 pounds applied axially to leads for one minute. Bend test shall consist of one bend from the point of egress, first 90° in one direction, back to the original axial position, and then 90° in the opposite direction with no evidence of breakage.

TEMPERATURE RANGE
−55°C to +85°C with full rated voltage applied.

SUB-MINIATURE RF CHOKES

An extremely versatile series of iron core R.F. chokes designed to meet the industries' demand for high reliability, ultra-miniature components. The coils are ideally suited to network and filter design, delay lines and computer applications. The coils are impregnated with a moisture resistant lacquer and on special order they can be fungus-proofed per JAN-T-152 using varnish per MIL-V-173A. They can also be encapsulated in epoxy resin to conform to Grade 1, Class B of MIL-C-15305. Note: L measured on 260A Q Meter except 120 thru 500 mH which are measured on 1 kHz Bridge.

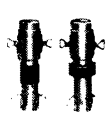
ECONOMY ADJUSTABLE R.F. CHOKES

Through the use of a recently developed Nylon molding process we are able to offer an inexpensive line of adjustable chokes. These items feature a wide inductance range which has been achieved through the use of a threaded ferrite core. They can be adjusted from either the top or bottom. This lends a degree of flexibility to your design. Mounting is achieved by means of a metal clip in a 5/16" round hole or a special keyed hole. Instructions supplied with each coil.



Dimensions: 3/8" x 1 3/8" long.

DUAL LINE FILTER CHOKES

Miller Dual Duo-Lateral Line Filter Chokes are wound with two coils on one form, giving the advantage of small physical size in cases where space requirements are stringent and two single coils would occupy too much area. Identical in specifications, except for dimensions, to our single type Duo-Lateral chokes. They are wound on white ceramic forms 2" in diameter by 4 1/2" long.

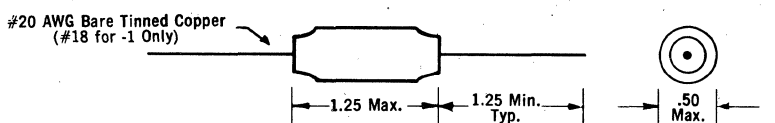
HIGH CURRENT CHOKES

TYPE 6150 10-100μH
Recommended mounting pitch — 1.50″



NOTES:

1. Effective inductance and Q measured on Boonton 260A Q-meter at frequencies specified, in accordance with MIL-C-15305.
2. Current rating (Rated IDC) is based on .75 watt power dissipation for approx. 20°C temperature rise. Depending on the application, these units may be operated at up to twice the rated current.
3. Incremental current (INCR I) is the minimum current at which the inductance will be decreased by 5% from its initial (zero — DC) value.
4. Dielectric Withstanding Voltage — 1000 VRMS.
5. Operating Temperature Range — −55°C to +85°C.
6. Materials:
   Coil Form — Ferrite.
   Magnet Wire — Type B per MIL-W-583.
   Jacket — PVC shrink tube.

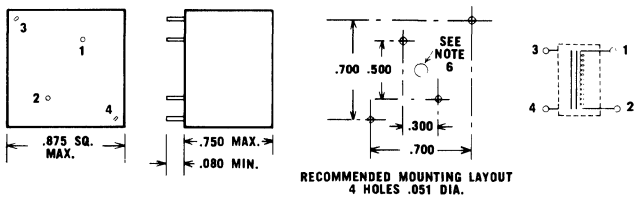
SHIELDED HIGH CURRENT CHOKES

TYPE 6900 10 μH — 82 μH — 10% Tolerance
100 μH — 1.0 μH — 5% Tolerance



SPECIAL FEATURES

SHIELDED — Magnetically shielded with ground lugs to minimize external field.

ENCAPSULATED — with epoxy for maximum ruggedness and moisture protection.

VARIABLE — with optional trimmer. See note 6.

STABLE — typical temperature coefficient of +76 ±28 ppm/°C from −30° to +70°C.

NOTES:

1. Inductance measured on General Radio 1650 B Impedance Bridge at 1 KHz.
2. Current rating (Rated IDC) is based on 1.0 watt power dissipation for approximately 20°C temperature rise. Depending on the application, these units may be operated at up to twice the rated current.
3. Incremental current (INCR I) is the minimum current at which the inductance will be decreased by 5% from the initial (zero-DC) value.
4. Dielectric Withstanding Voltage — 1000 VRMS.
5. Operating temperature range −55° to +105°C.
6. These units are available with an optional trimmer which, when fully inserted, will increase the inductance by at least 20%. Order by adding suffix "V" to dash numbers, e.g.: 6900 -25V is continuously variable from 1.0 mH ±5% to 1.2 mH +10% −5%. If bottom access to trimmer is desired, provide a 3/16" dia. center hole as shown in the recommended mounting layout.
7. Materials:
   Core — Ferrite.
   Case — Epoxy encapsulated.
   Magnet Wire — per FED SPEC J-W-001177/9 (MIL-W-583 Type B)

ALL NEW with this edition of EEM

GET ORGANIZED!

Are your catalog files organized? Can you find any given catalog in a matter of seconds? If your answer is "Yes," you probably already have the EEM File System. But, if you said "No," you really ought to look into this simple system. It will save hours of time and tons of aggravation.

The EEM File System was invented over twenty-five years ago to help people who specify, buy, or work with electronic products and equipment. It is upgraded on a constant basis to reflect the current state of the art. It's easy to use and easy to customize to your particular needs.

You say you want to file catalogs by type of product? That's easy to do with The System. But, what are you going to do when there are multiple products in one catalog? Take Mallory for example. There are all kinds of products in the Mallory Short Form Catalog. With the EEM File System all you do is file the catalog under "M" for Mallory and refer to it on all of the cross reference cards that apply.

There are thousands of EEM File Systems in everyday use in engineering and procurement offices all over the world. Shouldn't you be using this proven system?

The EEM File System is shipped in one neat package. The package contains everything you need to set up your very own filing system. Best of all, it's easy to get and very affordable. Send a check or money order for $25.00 and EEM will pay the postage and sales tax. If you must use a purchase order, please add $5.00 for postage and handling. An invoice will accompany your System.

Don't waste any more time. Get organized now!

INDUCTORS FOR SWITCH-MODE POWER REGULATOR, CONTROL AND NOISE FILTERING CIRCUITS

The **SKC SERIES INDUCTORS** are designed on gapped toroidal tape wound cores for DC switching power supply, regulator and energy storage circuits — DC current ratings **5 to 50 AMPS DC.**

The **SKL SERIES INDUCTORS** are designed on functional gapped toroidal tape wound cores for power circuits requiring high inductance at low DC currents and nominal inductance at rated DC amps.

The **SKP SERIES INDUCTORS** are designed on powered iron toroidal cores for RFI and EMI filtering and other noise absorbing applications. Also, **SKP SERIES INDUCTORS** are most useful in DC circuit applications, available in a wide range of "L" values and DC current ratings to **40 AMPS DC.**

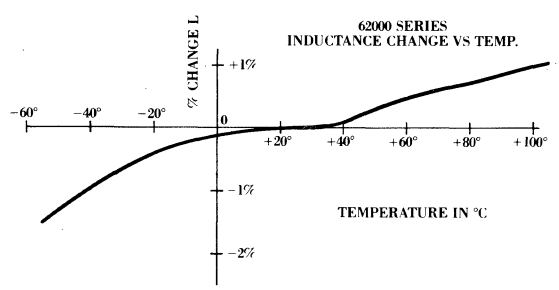
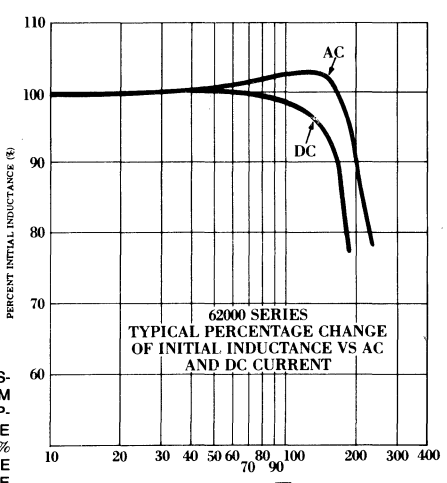
SPECIFICATIONS:

- INDUCTANCE TOLERANCE ±3% AT 0.1V-100KHZ
- INDUCTANCE STABILITY VS TEMPERATURE ±2% -55°C TO 105°C
- MEETS MIL-T-27D TF5R20ZZ
- WEIGHT 1 GRAM
- THERMAL SHOCK 100 CYCLES, METHOD 107D MIL-STD 202E TEST CONDITION A3
- UNIT HAS MAGNETIC SHIELD





ALL INDUCTORS ARE MEASURED AT 0 DC. THE MAXIMUM DC LISTINGS ARE FOR APPROXIMATELY 30°C HEAT RISE AND APPROXIMATELY 2% DROP IN INDUCTANCE. THE CHANGE OF INDUCTANCE WITH AC OR DC CURRENTS IS ILLUSTRATED BY THE CURVES. THE EXCITATION IS PLOTTED IN mA $\times\sqrt{mHy}$. FOR EXAMPLE THE 0.495 mH INDUCTOR (62272) WITH 170 mA DC FLOWING WILL HAVE AN EXCITATION OF mA $\times\sqrt{mHy}$ = 120, AND THE INDUCTANCE WILL DROP FROM 495 uH to 485 uH. IF THE 170 mA WAS AC, THE INDUCTANCE WOULD BE 510 uH.

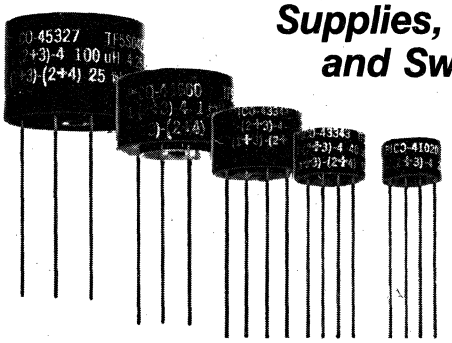
These Inductors are ideal for Noise, Spike and Power Filtering Applications in Power Supplies, DC-DC Converters and Switching Regulators



- Minimum possible size
- Meets MIL-T-27D (TF5S04ZZ)
- Special high frequency core material to insure low losses
- All units have split windings
- Large selection of sizes available
- All units are magnetically shielded

All inductors have split windings—ratings shown in table are for series connection. Parallel connection will have ¼ inductance at twice the DC current and ¼ the DC resistance, ie. parallel connection of PICO-41020 will have 5 millihenry at .12 Amps DC with DC resistance of 13.5 Ohms

PICO's EMI Common Mode Suppression Inductors

- **Minimum possible size**
- **130°C operation (Ambient + Temp. Rise)**
- **Windings Balance ± 1%**
- **Dielectric Strength .... 1500 Volts RMS**
- **All units are magnetically shielded**

These Inductors are well suited for use in Switching Regulators, DC to DC Power Supplies and all types of Electrical Equipment where the elimination of line transmitted Electromagnetic Interference is important. Electrical equipment will generate noise due to switching operations of transistors, SCR's, relays, triacs, etc. By using these Inductors, noise being fed back to the power line is minimized to an acceptable level and this noise will not interfere with other equipment operating on the same power line.

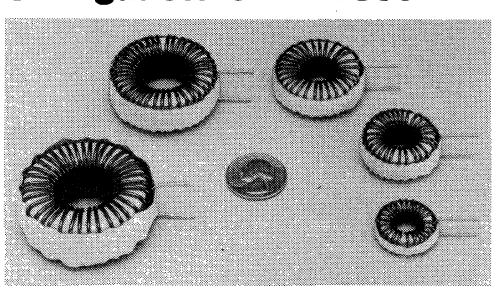
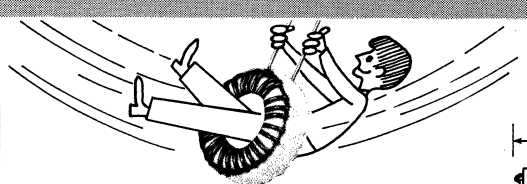
Swingductors™ RL1386





Designed for applications requiring a known inductance change with changing current loads (as in power supplies). Although similar in appearance to conventional toroids, the special core material allows a "controlled saturation," so that a specific inductance value is repeatable at a specific current. The core material is effective up to 1 MHz. As a result of toroidal design, the Swingductor™ produces a closed magnetic field, resulting in low EMI. All are supplied with pretinned leads for easy PC board installation.

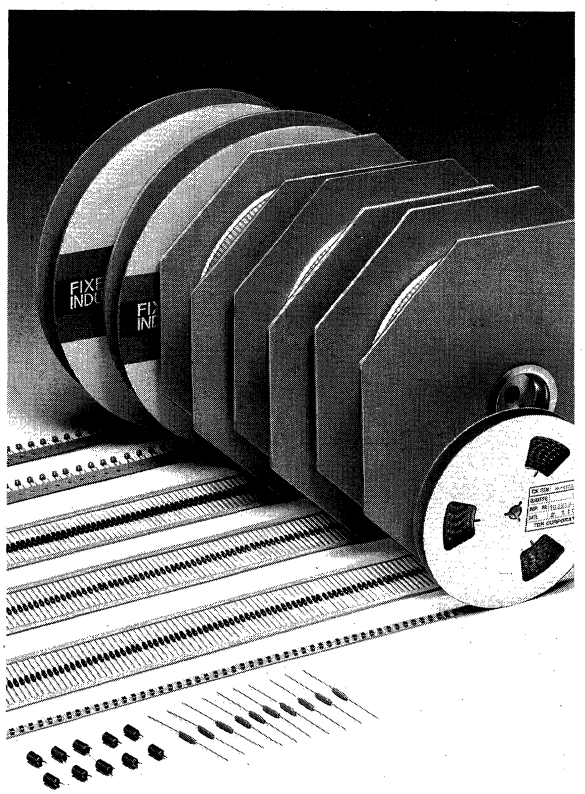
Fixed inductors are used in a wide range of applications including VCRs, color TVs, stereo car radios and radio transceivers, and industrial electronics. They are also used in power-driven tools as EMI filters.



Features

1) EL type
The radial lead type inductor is commonly found in consumer products, where most EL inductors are used. TDK's original design and automated production lines mean the reliability of these inductors is very high. The EL0405 uses a very compact design and is supplied on reels.

2) SP type
The axial lead type inductor is also used frequently in consumer products. The structure of the AP0408, 0410 and 0412 provide the smallest distribution capacity. Different types are available to meet the needs of automatic insertion equipment.

3) TP type
This type features high reliability and unusually stable characteristics because it is made using the transfer molding technique. The extremely small size of the TP0206 type makes it suitable for high density assembly PCBs in measuring instruments and control devices.

4) FS type
This small ferrite shield inductor has a high performance ferrite cap shape with a molded inductor. The FS0810 and FS1012 are ideal for magnetic shielding applications.

5) TPF0410 type
This highly reliable inductor complies with Defense Agency standards (MIL standards) for industrial applications requiring a magnetic shield.

6) NL, NLF type
Has metal tab type electrodes connected to coils encapsulated in heat-proof resins to ensure excellent reliability.

Designed to meet the requirements of MIL-C-15305, Grade 1, Class B (−55°C to +125°C). The rated temperature rise is 35°C above an ambient of 90°C. Overload current should not exceed 1.4 times the rated current. Dielectric withstanding voltage is 700 volts rms. The powdered iron cores used in these items possess excellent temperature stability and result in an inductor with low external magnetic field. This allows mounting in close proximity to each other and to other circuit components without ill effects.

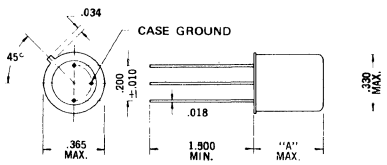
TG, TH SERIES



Series	A max.	Weight
TG	.390	.06 oz.
TH	.350	.07 oz.

The TG and TH series offer high "Q" inductors in a TO-5 transistor can configuration. High density packaging can be accomplished with little regard to coupling between adjacent circuitry since construction of these units results in a low external magnetic and electrostatic field.

TG SERIES

Recommended Frequency Range: 10 KHz to 500 KHz.

Inductance Tolerance: ±5%.

Inductance Stability: Less than ±2% from −20°C to +130°C.

Method of Test: Inductance is measured on a General Radio inductance bridge, Type 1632A with leads connected directly to bridge. "Q" is measured on HP4342A "Q" meter with leads connected directly to the "Q" meter terminals.

MIL-T-27, Grade 4, Class S.

Temperature Range: −55°C to +130°C.

Insulation Resistance: 10,000 Megohms minimum at 100 volts DC.

Dielectric Withstanding Voltage: 100 volts rms.

SOFT FERRITE MATERIALS

GENERAL DESCRIPTION — Allen-Bradley offers ferrite cores produced from three materials — designated W5, R02 and R03. Each material is designed to fulfill specific applications, since no material can provide the specific magnetic properties needed for every circuit.

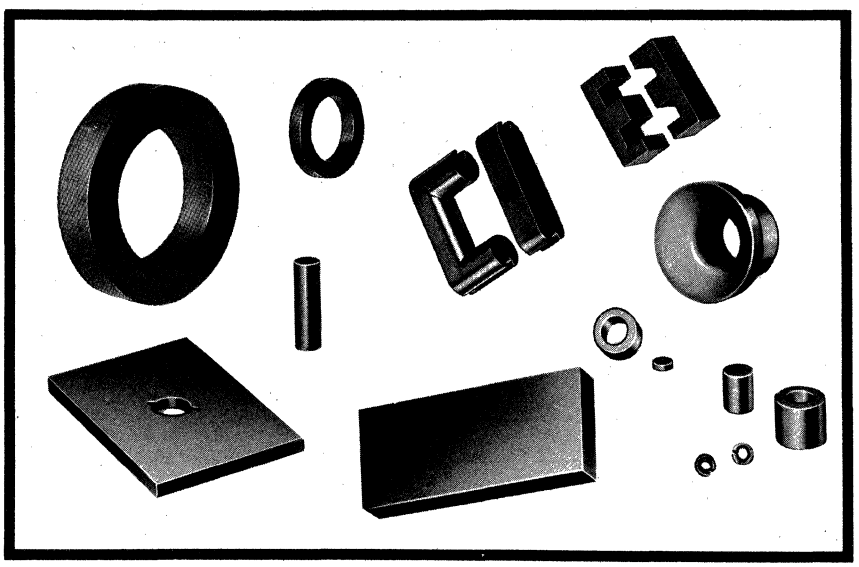
W5 MATERIAL — W5 is designed to be used in circuits where a low loss power ferrite is required. It is capable of operating at high flux densities at frequencies up to 500 KHz. Above 500 KHz, it may continue to provide useful performance when applied at low flux densities. Because of its low core losses, it is ideally suited for applications above 400 Hz where the excessive heating of laminated iron or tape wound cores becomes impractical. W5 also exhibits a linear B vs. H variation at flux densities less than 1500 gauss.

The versatility of W5 material is the major factor for the existence of the standard ferrite core program. This program offers W5 material in a variety of part shapes, namely Bar cores, E-cores, Pot cores, Toroidal cores, and U-cores.

R02 MATERIAL — For circuits operating at frequencies up to 10 MHz or where a temperature stable initial permeability material is required, R02 should be specified. R02 is ideally suited for demanding applications such as those requiring high Q and for temperature stable inductors. R02 material has core losses similar to those of W5 material cores, at frequencies between 500 KHz and 1 MHz. Between 1 MHz and 10 MHz core losses for R02 are less than those for W5. R02 is a desirable substitute for W5 at high frequencies.

R03 MATERIAL — This rectangular loop ferrite material exhibits high induction and low coercive force. It is useful in continuous switching applications which drive the core to saturation at frequencies less than 25 KHz. Rectangularity (Br/Bs) of greater than 80 percent makes R03 particularly suitable for magnetic amplifiers, frequency converters, and switching device applications.

Because of the increasing interest in R03 cores, this material is now available through the Standard Ferrite Core program. R03 is now available in eleven different sizes of toroids.



The following table is a summary of the typical characteristics of each material at 25° C.

Magnetic Properties	W5 16KHz	R02 4KHz	R03 1.5KHz
Saturation Flux Density (B_s) Gauss @ 10 Oersteds	4900	2750	3900
Initial Permeability (μ_i)	2800	290	325
Maximum Permeability (μ_{max})	4000	510	3500

CERAMIC PERMANENT MAGNETS

GENERAL DESCRIPTION — Allen-Bradley offers a wide range of ferrite permanent magnets in material grades M6 through M10. Each is an oriented ceramic permanent magnet material ideally suited for specific requirements. This wide range of materials allows the design engineer to custom fit his magnet choice to the needs of the application and the severity of the operating environment.

This selection of permanent magnet materials represents the most technically advanced ceramic grades available in production quantities today. Typical configurations are angular arc segments, rings, bars, blocks, cylinders and slabs. Common applications are:

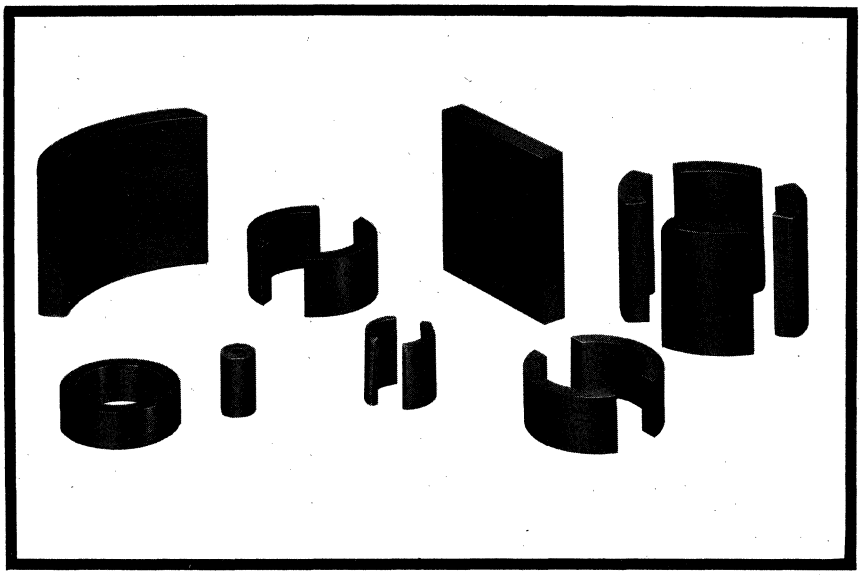
1. DC Commutator Motors
2. Brushless Motors
3. Synchronous Motors
4. Linear Actuators
5. Stepper Motors
6. Alternators and Generators
7. Magnetos
8. Magnetic Separators
9. Material Handling and Holding Devices

APPLICATIONS — Magnetic circuits that can be designed to take full advantage of the specific flux density and coercive force of each material offer opportunities for improved performance in the assembled product in one or more of the following ways:

1. Higher efficiency
2. Cooler operation
3. Greater output power
4. Smaller package size
5. Less weight
6. Lower cost

DESIGN VERSATILITY — A wide range of options using Allen-Bradley magnetic materials are available to the magnetic circuit designer.

- Large and small arcs - current sizes range from 1/10 oz. to over 5 lbs.
- Large and small blocks - current sizes range from roughly 1/100 oz. to over 10 lbs.
- Single or multiple pole patterns can be magnetized on a single magnet. The number of poles is limited only by the capability of magnetizing fixturing.
- Radial or transverse orientation.



MAGNETIZATION — It is usually desirable to magnetize the magnet after assembly to avoid handling problems. Since magnets are oriented in manufacture, they must be magnetized in the direction of orientation in order to obtain the listed magnetic properties. In other directions, only a fraction of the listed magnetic properties can be realized. These magnets require a magnetization force of 10,000 oersteds on 20,000 ampere turns per inch of magnet length in direction of orientation to secure proper magnetization.

DESIGN NOTES — The total flux produced by a magnet of any configuration is a function not only of the magnetic properties of the material from which it is made but also its physical dimensions, and the degree of orientation and other factors related to the manufacturing process. To insure delivery of flux as designed, the magnet must be magnetized to saturation and have sufficient coercive force to resist the demagnetizing effect of opposing magnetic fields to which it might be exposed.

The characteristics plotted on the next page show the normal and intrinsic demagnetization curves for each material at various temperatures. To avoid loss of flux, irreversible except by remagnetization, it is necessary that a magnet be operated above the knee of the demagnetization curve corresponding to the lowest temperature to which it may be subjected. The determination of this low temperature operating point must take into consideration not only the permeance coefficient of the magnetic circuit in which the magnet operates, but also any other demagnetizing m.m.f.'s which may exist.

COMPARATIVE PERFORMANCE —		M6	M7	M8	M9	M9B	M10

[1] The flux performance of production magnets will be within ±7% of the flux produced by a magnet having nominal print dimensions and typical residual induction.

Krystinel manufactures a comprehensive line of standard and custom made ferrite cores. We maintain a large inventory of standard sizes and shapes thus providing off the shelf delivery. Because of our extensive tooling inventory, we are able to provide many special shapes without tooling charges and with short turn-around time. Our high volume capability for in-house Parylene and epoxy coating is another good reason to come to us for quick delivery at competitive prices.

In addition to U.S. production, engineering, and sales facilities, our off-shore, labor-intensive operations make us competitive on a world-wide basis. Take advantage of our 30 years experience in manufacturing of high quality ferrrite cores and call us today.

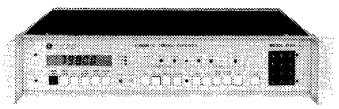
TIMING & FREQUENCY INSTRUMENTS

Austron manufactures a full line of instruments for precise management of time and frequency.

2100/2100F LORAN-C RECEIVER/MONITOR

Austron receivers are microprocessor-based, automatic acquisition and tracking receivers that utilize the LORAN-C groundwave to provide a traceable reference for time epoch determination, frequency management, calibration and control. These receivers provide time accuracy to one microsecond and frequency accuracy to parts in 10^{12}.



AUSTRON 2100

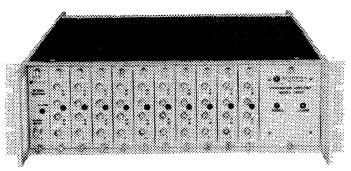
2110 DISCIPLINED FREQUENCY STANDARD

A state-of-the-art, microprocessor controlled system that automatically locks the frequency of its precision ovenized crystal oscillator to that of an externally applied reference having superior long-term stability. Uses a third-order servo technique to correct the frequency offset and aging of the internal oscillator. If the external reference is removed or fails, the 2110 will continue to apply corrections and will typically limit the frequency offset to parts in 10^{12} for several days following the reference loss.

AUSTRON 2110

1295C DISTRIBUTION AMPLIFIER

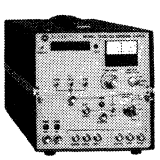
Provides the necessary noise immunity and drive capability to interface a local frequency standard to other equipment at distances up to 1000 feet. Four standard frequencies can be accommodated (10, 5, 1 and 0.1 MHz). For other frequencies consult factory. Input frequencies and number of outputs for each frequency are customer specified to provide a more cost effective system. Single frequency units can have up to 40 individual outputs, while units with 2 to 4 frequency inputs will have four or more outputs for each input.



AUSTRON 1295C

1210D SERIES PORTABLE CLOCKS

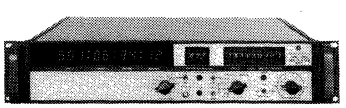
Compact, self-contained, self-powered time references providing stable time outputs at several pulse and sinusoidal frequencies with a digital time-of-day display.



AUSTRON 1210D

TIME CODE INSTRUMENTATION

A complete line of instruments from basic generators and readers to full complement tape search and control units. Available for bench, panel, rack or portable. All standard IRIG, XR3 and NASA codes are available to give these instruments the flexibility to meet any system requirement.



AUSTRON 8152

SYSTEMS

Complete systems for generation, management and distribution of precise time and/or frequency. Austron engineering has led to such sophisticated secure communication frequency control sets as AN/GSQ-174, AN/GSQ-183 and AN/GSQ-215.

Time and Frequency Receivers, Disciplined Standards, Distribution Amplifiers, Time Code Generators and Readers and all ancillary equipment along with Austron Engineering . . . put us to work, for you.

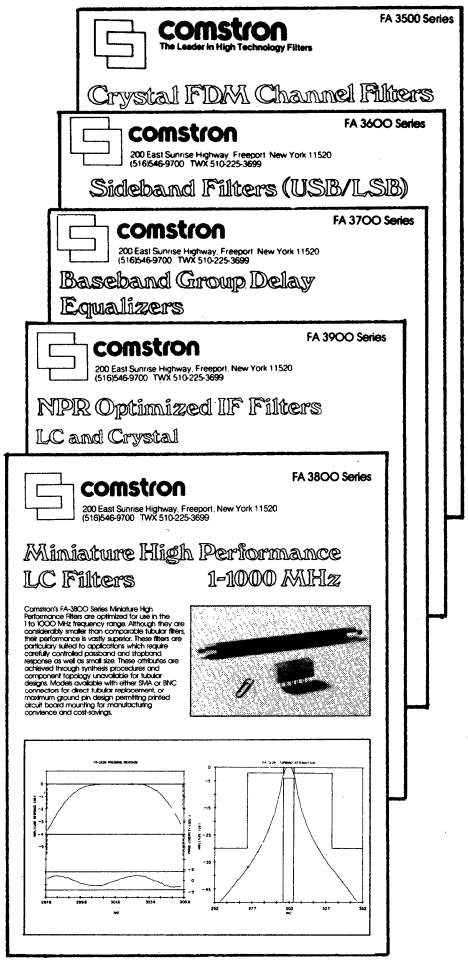
TECHNOLOGY "+" FILTERS

The Extra Edge in Systems Performance DC to 1 GHz

Comstron has developed optimum frequency or time domain filters to produce near theoretical system performance. These technology + filters are available as catalog items or custom tailored to your needs.



Design

Comstron has implemented modern network synthesis and physical realization techniques to the point where highly reliable, compact, LC and crystal filters are available – quickly and economically. Proprietary computer analysis, modeling, and optimization programs efficiently arrive at near-optium solutions to spectral, time domain, and stochastic problems. The Company's Enhanced Synthesis Program (ESP), Filter Optimization Program (FOP) and Parameter Optimization Program (POP) provide design parameters for systems oriented functions. Requirements for group delay equalization, wide band arithmetic symmetry, $x/\sin x$ amplitude correction, corrected Nyquist filters, phase compensation, and time domain response designs are routinely and efficiently handled.

Test

The Company's commitment to excellence is evident in its extensive test facilities. Automatic computer based network analyzers cover the frequency range from dc to 1.3 GHz with full plotting and printer output capability. Parameters which are automatically measured include amplitude response, phase response, group delay, and return loss. Time domain testing can also be performed to verify impulse response or response to complex waveforms.
Computer directed environmental testing allows unattended measurements of performance over temperature on a production basis. Comstron's proprietary Automatic Filter Test (AFT) programs permits rapid and accurate generation of acceptance test procedures as well as full documentation and data files when required.

Quality Control

Comstron maintains a Quality Control Department that ensures compliance with MIL-I-45208A and MIL-Q-9858A when applicable. Microscopic inspection, controlled environment, material control and traceability, solder training programs, and strict configuration management all contribute to producing an exceptionally reliable product.
The quality control program is continuously monitored. Over the years since its inception, Comstron has assembled a dedicated, conscientious staff whose pride of workmanship and customer loyalty is the keynote of the Company.

HOW TO SPECIFY A QUARTZ CRYSTAL

If the parameters for the crystal in question are not already covered by a MIL-SPECIFICATION or by a formal SPECIFICATION CONTROL DRAWING, then Items 1 through 6 are essential.

(1) **MODE OF OPERATION** i.e. fundamental, third, fifth, seventh, ninth or eleventh overtone.
(2) **HOLDER STYLE** i.e. HC-6/u, HC-18/u, HC-35/u, etc, depending on your individual application and the frequency.
(3) **CALIBRATION TOLERANCE AT REFERENCE TEMPERATURE** i.e. ± 20 ppm @ + 25°C, ± 5 ppm @ + 75°C, etc.
(4) **TEMPERATURE STABILITY** the allowable frequency deviation over a specified temperature range, with reference to the actual frequency measured at the calibration temperature. (i.e. ± 15 ppm, ± 2.0 ppm, etc.)
OR TOTAL TOLERANCE the total allowable deviation over a specified temperature range, with reference to the nominal frequency (i.e. calibration tolerance and temperature stability combined). (i.e. ± 50 ppm, ± 30 ppm, etc.)
(5) **OPERATING TEMPERATURE RANGE** the temperature range over which the temperature stability or the total tolerance is to be effective.
(6) **CIRCUIT CONDITION** will be either PARALLEL or SERIES resonance. If PARALLEL resonance, please state the load capacitance.

SPECIFICATION CODING

We use a system whereby we code the major parameters of a crystal specification using a combination of 9 digits. A typical code would be **A251DFE-32** and would be interpreted as follows. **A** = fundamental mode, **25** = HC-25/U holder, **1** = undercut pins per MIL-H-10056, **D** = calibration tolerance of ± 10 ppm @ + 25°C, **F** = temperature stability of ± 20 ppm with reference to the actual frequency measured @ + 25°C, **E** = temperature range of — 15°C to + 65°C over which the temperature stability is effective, **-32** = a circuit condition of parallel resonance and with a load capacitance of 32 pF.

Precision Quartz Crystal Resonators

I. DESCRIPTION

CTS High Stability Precision Resonators are used where specific tight parameter control is required. These crystals are used in communication, instrumentation, and military applications where specialized performance, documentation, or testing demands extra attention. These crystals are either calibrated at room temperature, or at elevated temperature for ovenized oscillator applications. Holder types see Fig. 8 and Fig. 9.

MIL-Equivalent Crystals

MIL-C-3098G requires special testing to ensure compliance with the entire specification. Any crystal marked with the "CR" number must receive this testing.

If your required crystal details match those of a mil spec in general parameters, but your commercial application does not demand the exhaustive testing, you can order a mil equivalent crystal. The design will be the same. The crystal **will not** receive the detailed testing. Marking will be standard commercial marking. The "CR" number will not appear on the crystal.

A mil vs commercial cross reference is shown below:

CTS Standard Microprocessor Crystals

CTS Knights offers 45 standard microprocessor crystals to use with many of the popular microprocessors on the market. CTS microprocessor crystals feature low start-up resistance. Reliability is assured by use of a MIL-approved Quality Control process. These are solder seal and resistance weld crystals with 0.5" minimum lead lengths.

Microprocessor crystals are available as "off-the-shelf" items from authorized CTS distributors.

Top wires and/or insulating sleeving can be ordered special with minimal cost and leadtime.

SPECIAL REQUIREMENTS

- ELECTROMAGNETIC INTERFERENCE PROTECTION The metal package construction, used extensively on CTS Knights hybrid oscillators, effectively reduces radiated EMI due to the oscillator circuitry. Further reduction can be accomplished by connecting the case to circuit ground, which is standard on MXO and CXO series oscillators. Case grounding is specified by a "G" in the part number (eg. MXO-55GA, CXO-65GA). CTS Knights has also gained considerable experience in reducing conducted EMI in specific customer applications. Contact CTS with your EMI problems or requirements, we'll offer a solution.
- SURFACE MOUNT APPLICATIONS — CTS Knights presently offers a number of options to suit your surface mount needs. Besides the CCXO series, leadless chip carriers, we are offering the MXO-55 style package in an economical surface mountable configuration, through a simple lead formation operation. The surface mount option is specified by adding an "S" to the part number (eg. SMXO-55, SCXO-65).
- HIGH RELIABILITY SCREENING — All hybrid oscillators, at your option, may be screened to the Class B requirements in method 5008 of MIL-STD-883. Hybrid construction would be in accordance with appendix G of MIL-M-38510. To request this option, add "-883" after the part number (e.g. MXO-55GA-2C-16.0 MHz-883).
- VAPOR PHASE REFLOW — Although CTS Knights' hybrid oscillators are capable of withstanding hand and wave soldering processes, the standard devices are not manufactured to survive vapor phase reflow profiles without degradation to device reliability. A special, high-temperature construction process is available at your request, to allow vapor phase reflow with little effect on device performance and reliability.
- CUSTOM DESIGN CAPABILITIES — CTS Knights' in-house capabilities include circuit design and artwork generation, crystal and hybrid thick film manufacturing facilities, manual and automated manufacture and test techniques, and mechanical and environmental testing. This gives CTS a unique flexibility to design and manufacture to your custom hybrid oscillator specifications. Consult the innovative staff at CTS Knights with your special requirements.

Custom-Built Filters

The basic building block for all custom built CTS Knights filters is the two-pole monolithic filter available in standard package styles as shown in figure 34.

Two-pole monolithic filters can be cascaded to produce four, six and eight or more pole filter responses with the addition of coupling capacitors between two-pole sections. Using the bandwidth and shape factor charts (fig's. 32, 33) the equipment designer can specify an inexpensive filter supplied by CTS Knights to his specifications as a set of two, three, four or more "Monolithics" (coupling capacitor information will also be provided). For applications requiring plug-in packaged filters, the filter specifier may select one of the five standard CTS Knights packages (fig's. 35, 36, 37, 38, 39) or supply dimensional, termination and mounting information on a package of his choice.

Input/Output impedances of packaged filters may be specified at 50 ohms minimum.

Filter parameters such as insertion loss, ripple, spurious response and ultimate attenuation are not easily chartable. However, some general guidelines to specifying these values are given below:

Insertion loss — typically 1.5 dB per 2-pole section
Ripple — 1 dB minimum for most designs
Ultimate attenuation — 35 dB maximum per 2-pole section for acoustically coupled designs
Spurious attenuation (Best attainable for most designs)

2-pole	20 dB	6-pole	45 dB	10-pole	75 dB
4-pole	35 dB	8-pole	60 dB

Low Noise VCXOs

Damon low noise miniaturized VCXOs are all solid state quartz crystal stable oscillators whose frequencies can be varied linearly by an external DC or AC modulating signal. Only a source of power and control signal are required . . . no auxiliary compensating circuitry.

EFRATOM is the recognized world leader in precision time and frequency systems for military/aerospace and commercial applications. Utilizing state-of-the-art atomic oscillator technology, EFRATOM has conceived and developed a family of time and frequency references that find valuable application in radio navigation, geophysical survey positioning systems, satellite tracking and control, communication systems employing PCM and spread spectrum techniques and standard time and interval generation and transfer.

EFRATOM's Model M-1000 is the world's smallest military atomic oscillator measuring just 3.25 in x 3.25 in x 4.5 in (83 mm x 83 mm x 114 mm), yet this instrument has excellent long term stability and fast warm-up performance. Developed specifically for military use, the Model M-100 and M-1000 rubidium oscillators are radiation hardened and offer unparalled performance in the toughest of airborne and ground environments.

EFRATOM also offers a modular line of frequency components, Model MFS in a 19 inch rack, permitting the user to configure unique time and frequency systems including GPS and Omega calibration.

Complimentary to its range of precision oscillators, EFRATOM offers the Model MRT ultra-stable atomic frequency standard for laboratory and field calibration. More recently, EFRATOM introduced its Atomic Oscillator Test Set, Model TS-105A, for frequency stability (Allan Variance) measurements, and a Phase noise Test Set, Model MNT.

EFRATOM's scientists, in conjunction with NBS, have developed a Compact Passive Hydrogen Maser for commercial production (not pictured above, but specified below).

GET ORGANIZED!

Are your catalog files organized? Can you find any given catalog in a matter of seconds? If your answer is "Yes," you probably already have the EEM File System. But, if you said "No," you really ought to look into this simple system. It will save hours of time and tons of aggravation.

The EEM File System was invented over twenty-five years ago to help people who specify, buy, or work with electronic products and equipment. It is upgraded on a constant basis to reflect the current state of the art. It's easy to use and easy to customize to your particular needs.

You say you want to file catalogs by type of product? That's easy to do with The System. But, what are you going to do when there are multiple products in one catalog? Take Mallory for example. There are all kinds of products in the Mallory Short Form Catalog. With the EEM File System all you do is file the catalog under "M" for Mallory and refer to it on all of the cross reference cards that apply.

There are thousands of EEM File Systems in everyday use in engineering and procurement offices all over the world. Shouldn't you be using this proven system?

The EEM File System is shipped in one neat package. The package contains everything you need to set up your very own filing system. Best of all, it's easy to get and very affordable. Send a check or money order for $25.00 and EEM will pay the postage and sales tax. If you must use a purchase order, please add $5.00 for postage and handling. An invoice will accompany your System.

Don't waste any more time. Get organized now!

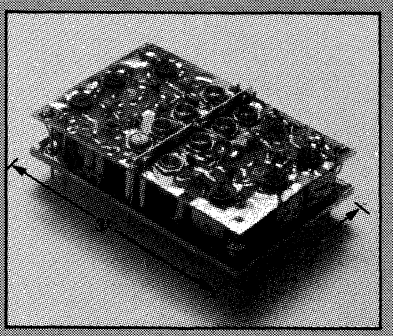
Hughes Custom Filters and Oscillators

Crystal Filters

Hughes has over 20 years of experience with all standard types of bandpass filters, including Butterworth, Chebychev, Elliptical, Gaussian and Bessel types, as well as band reject filters and crystal discriminators.

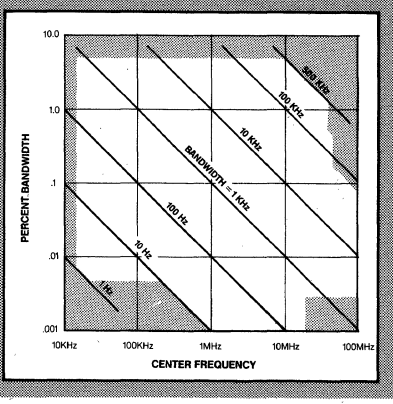


Characteristics

Hughes filters are designed using advanced computer-aided network synthesis and analysis techniques resulting in filters with sharp selectivity, controlled group delay or phase response, non-ringing pulse response and low insertion loss over wide temperature ranges. Hughes has also developed proprietary designs which permit tight control of phase and group delay characteristics or time domain response characteristics such as peak overshoot and ringing in response to pulsed RF signals. Hughes Frequency Control Devices meet the most stringent military standards, when required.

Applications

Hughes Frequency Control Devices are in use in satellites, radar systems, missiles, military and commercial communications and avionics systems.



Typical Specifications

How to Determine the Feasibility of Your Filter

The graph at right shows the general operating region of Hughes filters as determined by center frequency, bandwidth and/or percent of bandwidth. If your filter falls within the white area, Hughes can readily design and produce such a filter. If your filter falls outside the white area but near the boundaries of this chart, you should discuss your requirements with the Hughes design engineering staff, since your filter may still be practical to produce.

Voltage Controlled Oscillator — This crystal oscillator generates a TTL Frequency which is controlled by an input voltage. Although the voltage-frequency relationship is not linear, the circuits for the end-point frequency/voltage parameters are defined, as is the center frequency voltage. Since the VCXO usually operates in a closed loop the exact input voltage vs. frequency transfer characteristic is less important.

Uses:

- To clean-up a noisy signal by precisely duplicating it without noise
- To multiply a frequency by a precise integer (N)
- To multiply a frequency by a fraction $\left(\frac{N}{M}\right)$ with zero error
- To detect the frequency modulation, within the frequency limits, of an incoming signal
- Any combination of the above

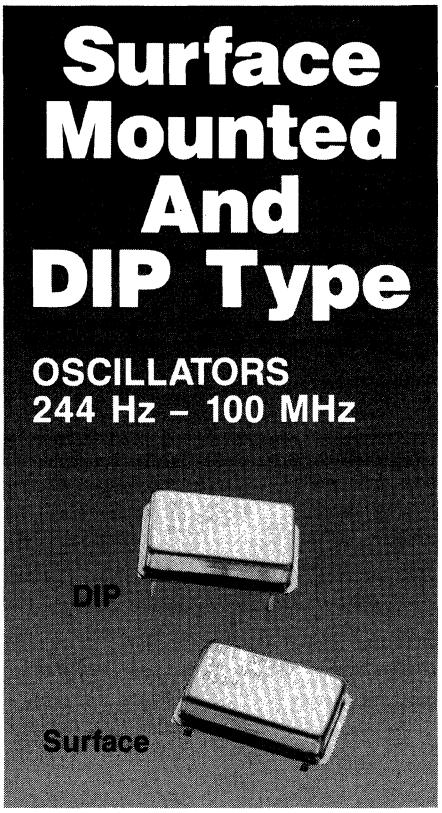
OSCILLATORS 244 Hz – 100 MHz



TTL & MOS Midland-Ross' latest design uses a high-quality custom integrated circuit which reduces the number of internal parts and wire bonds, improves reliability and performance. The custom IC reduces current drain, improves output waveform and has the ability to drive both MOS and TTL logic. This includes CMOS, HCMOS and NMOS.

Z80/8000 The 180 Series oscillators are designed to provide output levels compatible with the requirements of Z80/80A/80B/8000/8000A microprocessors. Proper operation is insured through active pull-up on the output logic levels.

ECL The 600 Series oscillators provide MECL 10,000 Series compatible signals. With pin 7 as case ground, the all metal welded package also provides improved RF shielding.

BAUD RATE GENERATORS The 1100 Series generators use a +5V input to provide stable reference frequencies needed by serial interface devices, such as UARTs, modems, teletypewriters, cassettes, etc. They feature choice of 16 output frequencies, direct UART/USRT compatibility and full duplex communications. 1100B has an F_0 output. 1100C has F_0 and $F_0 \div 4$ outputs with zero error at 19,200 baud.

ENABLE/DISABLE The 1300 Series oscillators provide enable/disable TTL compatible signals for bus connected systems. The HS-1300 has logic 0 enable. The HS-1310 has logic 1 enable. In the disabled state the output presents a high impedance to the bus (load).

DUAL OUTPUT COMPLEMENTARY TWO-PHASE The 2100 Series oscillators offer a complementary, non-overlapping output with guaranteed delay timing performance limits between the two outputs in a single package.

DUAL OUTPUT TTL The 2200 Series oscillators introduce F_0 and $F_0 \div 2$, 4, 8 or 16 . . . two different, discrete synchronous, TTL compatible clock sources in the same package.

DUAL OUTPUT SINGLE FREQUENCY The 2820 Series oscillators are intended to fill the need of digital systems or microcomputers for a dual output clock that is TTL and MOS compatible, using 5 volt single rail power source. They are particularly suited for Z80/8000 microprocessor systems, providing the same frequency for both TTL and MOS outputs.

DUAL OUTPUT DUAL FREQUENCY The 2840 Series oscillator is similar to the 2820 Series, but provides a TTL compatible clock at 2^n times the MOS clock, where n=1, 2, or 3.

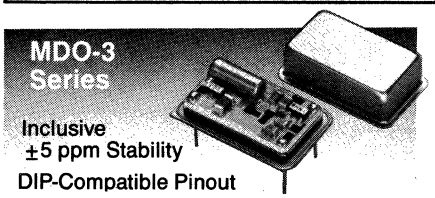
TCXOs, Quartz Crystals Monolithic Filters



The DIP-compatible MDO-3 Series TCXO is in an all-metal, welded package for full hermetic seal. Its ±5 ppm stability is inclusive of variations in temperature, voltage, load, and humidity over the full temperature range from −30°C to +70°C and over a frequency range of 10 MHz to 20 MHz. The MDO-3 makes use of the Motorola AT-Strip crystal to achieve reduction in size and improvement in mechanical shock survivability over earlier designs. Operates from +5V dc source.

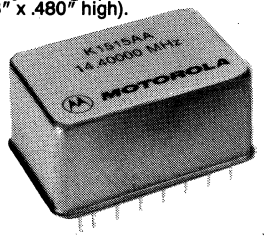
MDO-2 Series

Inclusive ±2 ppm Stability, Full Hermetic Seal

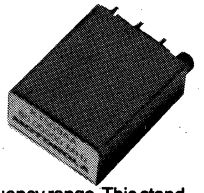
The ±2 ppm frequency stability of the MDO-2 oscillator series is inclusive of voltage and humidity variations while operating over a wide temperature range from −35°C to +85°c. The all-metal welded package offers a full hermetic seal which keeps the oscillator on frequency in environmental extremes of temperature and humidity — high performance with small size (0.8″ x 0.8″ x .480″ high).



MDO-1 Series

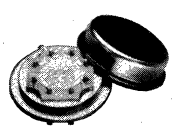
±1 ppm Stability Full Hermetic Seal

The MDO-1 Series oscillator is an ideal substitute for an ovenized oscillator in many applications while using considerably less space. The ±1 ppm stability is maintained over the full temperature range of −30°C to +90°C. The MDO-1 is contained in an all-metal, welded package for full hermetic seal and for minimized RFI.



MSO-1 & 2 Series

The MSO oscillator series, specially designed for communications equipment, is available over a wide frequency range. This stand-up version uses minimal boardspace area. Tight stability and frequency modulation are optionally available.



MFX Crystal Filters

The MFX filters offer 4-pole narrow bandwidth performance, from 45 MHz to 175 MHz, in a single TO-8 package. The MFX series filters are available (a) in a straight 4-pole configuration, (b) as two separated 2-pole filter configuration, or (c) as a custom circuit module, tested and adjusted by Motorola for your application.

Monolithic Crystal Filters

The disciplines of physics, electrical engineering, and material science are combined with computer-aided Monte Carlo design techniques to create optimum state-of-the-art monolithic crystal filters. Several patented techniques have thus been developed to improve spurious response, stop-band rejection, and intermodulation levels. A broad capability exists to design discrete filters and monolithic filters from two to twelve poles, with frequency capabilities from 5 MHz to 200 MHz.

Motorola offers a complete line of standard filter models designed for use in communications equipment requiring IF filtering. Some of the more popular frequencies at 10.7 MHz, 21.4 MHz, and 45.0 MHz are readily available in a variety of package styles. RASCO
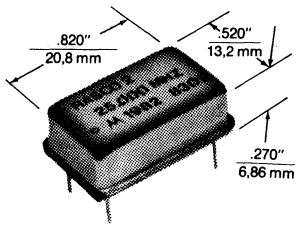
The new generation of data clock oscillators



Ultra-Reliable RASCO Oscillators feature drastic reduction in internal component count and minimal interconnects for greatly improved MTTF (Mean Time To Failure). The standard RASCO series is TTL compatible, driving up to 10 standard or LS logic gates. RASCO "C" series oscillators are compatible with high speed CMOS logic, capable of driving devices with highly capacitive loads. Both feature low current drain.

The rise and fall times of the RASCO oscillators are rigidly controlled so as to be compatible with the stringent requirements of microprocessors. Stabilities are available from ±0.005% to ±1.0% to suit application or budget requirements. Worst-case symmetry is 60/40% standard; 55/45% optional (RASCO-S series).

All-Metal Package — all current Motorola data clock oscillators are enclosed in all-metal, welded packages with full hermetic seal for excellent resistance to extremes of heat/humidity. Pin 7 is case ground, offering improved shielding to minimize RF radiation, helping to meet EMI specifications. The oscillators can be soldered in standard wave-line operations without damage; insulated standoffs permit proper defluxing. They can also be plugged into a standard DIP socket; dimensions are shown above.

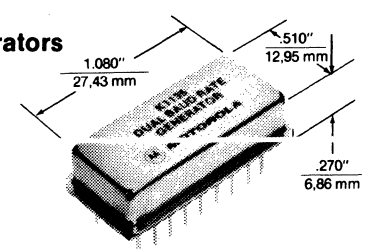
TTL Compatible K1100AM is available from 250 kHz to 70 MHz, has ±0.01% all-inclusive stability. **K1144AM, K1145AM, K1114AM, K1115AM,** and **K1116AM** offer differing stabilities. **K1158AM** (1 to 30 MHz) offers extended temperature range. **K1161AM** provides dual complementary outputs, while model **K1163AM** has a second output at half the clock frequency.

CMOS Compatible K1152AM is a low power clock oscillator available from .825 kHz to 10 MHz. K1144AM (2.5 MHz to 20 MHz) offers ±.0025% stability for CMOS applications.

μP Clock Driver

The **K1160AA** provides a 2.5 MHz to 10 MHz MOS output to drive Zilog or equivalent microprocessors. It also has a TTL output at twice the processor frequency for other systems timing.

Baud Rate Generators
K1135 Series



Also enclosed in all-metal, welded packages, these generators provide the stable reference frequencies needed by serial interface devices (UARTs, modems, teletype, cassettes, etc.). They feature choice of 2x16 output frequencies, direct UART/USRT compatibility, full duplex communications. Version B has an Fo output, Version C also has Fo and Fo÷4 outputs and has zero error at 19,200 baud.

Available in +5V only. K1135AA, K1135BA, and K1135CA are identical to standard models K1135AM, K1135BM, and K1135CM except that they do not require a +12V source.

K1149AM
ECL Compatible
Crystal Clock Oscillator

ECL 10KH Based Design — provides improved rise and fall times, duty cycle, noise margins and power supply rejection over earlier 10K family while retaining compatibility. The open emitter output allows the user to select the load termination to optimize performance.

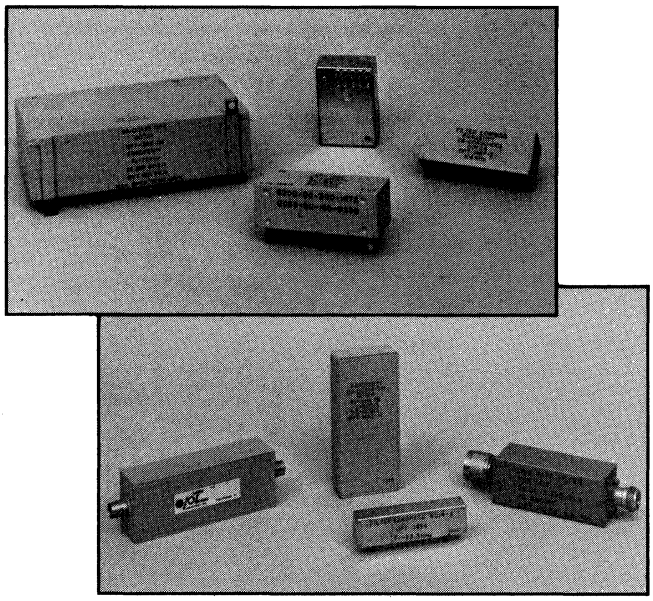
CUSTOM FILTERS
Engineering & Manufacturing

DISCRETE CRYSTAL FILTERS • LC FILTERS AND NETWORKS • MONOLITHIC CRYSTAL FILTERS



OPT's custom engineering and manufacturing capabilities for monolithic crystal filters range from 4.0 MHz to 30 MHz with relative bandwidths from .04% to .3% of center frequency. Discrete crystal filters range from 1 KHz to 70 MHz with relative bandwidths upwards from .005% of center frequency.

LC Filters and networks include low pass, band pass, high pass, band reject, amplitude and delay correcting, impedance matching in frequencies ranging from DC to 400 MHz with relative bandwidths higher than .2% of center frequency where design permits.

OPT's success in meeting and achieving new goals is reflected in our continued participation in many advanced military programs as well as high quality communication systems.

OPT, in addition to complying with MIL-F-18327 has on certain programs complied with MIL-Q-9858A requirements.

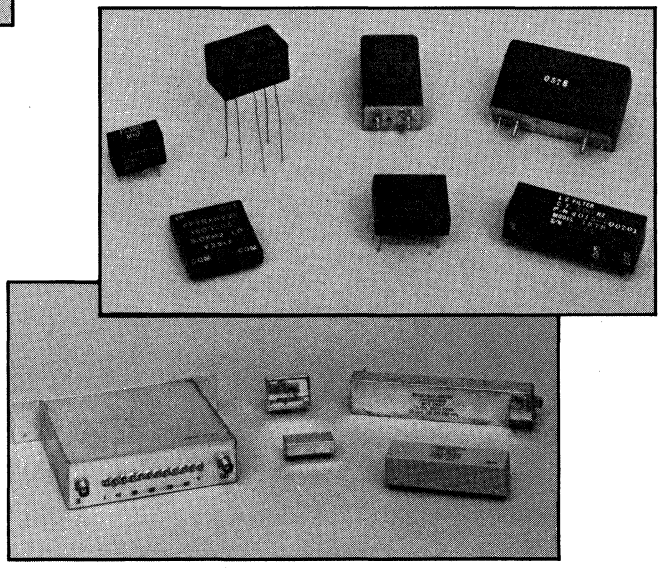
OPT is at the forefront of filter engineering as a result of company sponsored research and development in addition to the technology gained thru the acquisition of all engineering drawings and manufacturing rights from the following companies:

- Bulova Filter Co.
- Filtech
- Omnitec
- Burnell & Co.
- Nytronics
- Ortho Filter

Broad application experience supported by a library of computer synthesis, analysis and optimization programs, assist in supplying the best solution to specific requirements.

OPT is unique in being able to provide in depth engineering support on prototype development as well as quality controlled manufacturing capacity to supply high volume requirements.

Component stabilization procedures permit guaranteeing maximum stability with operating life. Areas of specialization include delay correction, phase matching and time domain synthesis.



(Top Right) NASA high reliability bandpass filters for use in space shuttle telemetry system. Built to MIL-STD-810C, method 514.2, proc. 5, part 2, curve AH; shock MIL-STD-202, method 213B, cond. k; temp. −30°C to +75°C.

(Bottom Right) Ultraminiature passive low pass filters stable over temperature. Used in codec inputs and secure communications CVDT's.

(Far Right) Phase and amplitude matched filters for sonobuoys and phased array sonars. Temp. −20°C to +65°C. Phase is matched over temperature to <3° for any number of channels.

- Very versatile to be used a programmable oscillator with frequency choice within crystal frequency range of 3.20 MHz to 5.20 MHz
- Internal crystal oscillator fully tested to meet your variety of temperature stability requirements.
- CMOS, TTL Compatibility
- Choice of 2x16 output frequencies, selectable by manual or software control.
- Dual feature allows to receive and transmit simultaneously.
- Resistance weld, hermetically sealed 18 Pin - Dip package, can be screened to MIL-STD-883B.
- TM1135D has direct oscillator frequency available at Pin 1 along with divide by 4 (oscillator ÷ 4) available at Pin 10. TM1135C is similar to TM1135D except oscillator frequency is not available at Pin 1.
- TM1135E is same as TM1135D except crystal frequency is 4.9152M Hz to get zero error at 19,200 baud.

GET ORGANIZED!

Are your catalog files organized? Can you find any given catalog in a matter of seconds? If your answer is "Yes," you probably already have the EEM File System. But, if you said "No," you really ought to look into this simple system. It will save hours of time and tons of aggravation.

The EEM File System was invented over twenty-five years ago to help people who specify, buy, or work with electronic products and equipment. It is upgraded on a constant basis to reflect the current state of the art. It's easy to use and easy to customize to your particular needs.

You say you want to file catalogs by type of product? That's easy to do with The System. But, what are you going to do when there are multiple products in one catalog? Take Mallory for example. There are all kinds of products in the Mallory Short Form Catalog. With the EEM File System all you do is file the catalog under "M" for Mallory and refer to it on all of the cross reference cards that apply.

There are thousands of EEM File Systems in everyday use in engineering and procurement offices all over the world. Shouldn't you be using this proven system?

The EEM File System is shipped in one neat package. The package contains everything you need to set up your very own filing system. Best of all, it's easy to get and very affordable. Send a check or money order for $25.00 and EEM will pay the postage and sales tax. If you must use a purchase order, please add $5.00 for postage and handling. An invoice will accompany your System.

ECL/VHF/UHF CLOCKS & SOURCES

ECL and sinewave clocks and sources are available to 400 MHz. Q-Tech will work with you to provide hybrid versions of high stability sources and synthesizers up to 1 GHz. Phase noise and G-sensitivity data are taken when required. Full temperature range −55°C to +125°C is available for these clocks and sources.

TTL OUTPUTS

Standard TTL outputs can drive up to 10 TTL loads. Some Q-Tech clocks use low power Schottky (LS) dividers and gates to reduce internal power consumption. These units drive 2 TTL loads or 4 LS loads over the full military temperature range.

CUSTOM HYBRIDS & OTHER PRODUCTS

Z80 AND Z8000 DRIVERS

Q-Tech type QT4/QT6 devices can be supplied with the output capable of driving the capacitive load, with appropriate logic levels, and rise and fall times. Such devices are ordered as QT4 "Z" XX - frequency, or QT6 "Z" XX - frequency where XX refers to frequency/temperature tolerances.

CMOS CLOCK OSCILLATORS

Q-Tech clocks are available using high voltage CMOS (4000 series) or the newer, high speed CMOS. Extra outputs, gates and special digital functions can be included, often at small additional cost. Very accurate symmetry requirements can be met where required. Frequency ranges are available from fractions of a Hertz (Hz) to well above 20 MHz.

SPECIAL PACKAGES AND ENCLOSURES

We can provide units to unusual package requirements, including miniature units withstanding 10,000 psi and Flat Packs ("Butterfly") with less than .100" thickness, ultra-thin (.085") Ceramic Leadless Chip Carrier (LCC) packages and many others.

BAUD RATE GENERATORS

Baud rate generators are clock oscillators producing an output clock signal at a frequency which is selectable. The output frequency is selected or programmed by logic levels on four control pins of the generator. The output frequency is equal to 16 times the selected baud rate, from 50 baud to 19,200 baud.

Q-Tech's military quality Baud Rate Generators are dual units with two independently selectable outputs. These units, typically used in serial interface devices such as UARTS, modems, teletypes and cassettes, operate from a single 5 volt power supply. All units are built to the requirements of MIL-M-38510 and are available operational over the full military temperature range and screened to MIL-STD-883. For full details request Bulletin BRG.

MICROPROCESSOR CLOCK DRIVERS

Q-Tech has developed clock generators/drivers with crystal oscillator stability for almost all known microprocessors, including the recent 16- and 32-bit architectures. Versions are available with TTL and/or NMOS output levels (as required), plus internal logic to allow memory clock cycle stretching and system reset/refresh control. These microprocessor drivers are capable of driving high capacitance inputs and meeting other special clock requirements. They are available in both commercial and full MIL-spec designs. The MIL-spec versions comply with all the requirements imposed by a military or space environment, and are capable of meeting frequency tolerances as tight as ±50PPM over the extended temperature range of −55°C to +125°C. These units are manufactured to the qualification requirements of MIL-M-38510 and MIL-STD-883. For full details request bulletin MCD.

VCXO

Q-Tech clocks can be provided with frequency shift by external voltage capability. Often used to phase-lock a clock to a master frequency source, a typical "pulling" (frequency shift) range is ±150PPM (±.015%) for a control voltage range of 8V. Consult the factory for other range/capabilities. Also consider packaging your phase lock loop dividers, phase detector and loop amplifier in one custom hybrid to save cost and space.

CUSTOM HYBRIDS

Q-Tech offers the opportunity to greatly reduce circuit board size and volume by converting a printed circuit design to a custom hybrid. We offer a range of services to accomplish this, including circuit consultation and in-house design. In addition, Q-Tech performs substrate screening, firing, and of course hybrid fabrication and testing. We would be pleased to bid on your hybrid needs.

Crystal Products

Crystals of proven reliability for military and industrial applications

For 40 years, Reeves-Hoffman has been a leader in the design and manufacture of quartz crystals for government and industry. We are the only company offering the improved stability of coldweld sealing at a lower cost than conventional solder-sealed units.

All Reeves-Hoffman crystals are cut, ground, polished, plated, and mounted at the factory to exacting specifications. Shock, vibration, and hermeticity characteristics all exceed Mil-Spec C-3098. Crystals for oscillator and filter applications are available from 1 kHz to 200 MHz, with varying temperature coefficients, effective resistance, electrical equivalents, and Q values dependent on physical limitations and circuit requirements.

The staff of crystal engineers at Reeves-Hoffman welcomes the opportunity to quote on and discuss your particular application.

Ask for our free booklet, "A Specifier's Guide to Quartz Crystals," written to reduce your design problems.

Low-Frequency Crystals

1.0 to 1200 kHz in standard and miniature holders

Throughout our long history as a quality supplier of low-frequency crystals, Reeves-Hoffman has dedicated our efforts towards responding to the changing needs of the electronics industry. As miniaturization reduced the size of electronic equipment, the traditionally large low-frequency crystal became one of the largest components in the system. To respond to this, Reeves-Hoffman worked closely with the crystal users. As a result, miniature crystal holders such as the RH135, RH170, RH605, and RH3X8 were developed. This is just one example of Reeves-Hoffman's ingenuity and responsiveness to the needs of our most important asset...our customers.

High-Frequency Crystals

1.0 to 200.0 MHz

The use of high-frequency crystals has grown continually over the years as timing rates, tranmission frequencies, and data-processing speeds increased. Fortunately, Reeves-Hoffman is continually involved in this evolution to the extent that we possess the capabilities to respond to just about any requirement for high-frequency AT-cut crystals. In the past, many challenges have been presented to our engineering and manufacturing personnel. We are extremely proud of their response record, and look forward to working with you to continue this trend.

Crystal Filters

Reeves-Hoffman custom designs and manufactures passive quartz crystal filters to meet the exacting specifications of companies at the leading edge of technology.

By utilizing computer-aided design and analysis, our staff of professionals can solve your most perplexing problems. Computer controlled frequency synthesis and network analysis provide accurate testing of amplitude, phase, and delay to assure precise filter performance. Image parameter, modern network theory (Butterworth, Chebyshev, Bessel, Gaussian, Cauer) and Lerner synthesis techniques are employed to obtain the desired frequency response.

Because of Reeves-Hoffman's military approved crystal manufacturing capability, we are able to produce quartz crystals which will satisfy the demands of the filter design. The high standards of our Quality Control Department assure that both crystals and filters are manufactured and tested to applicable military specifications.

SAW Resonator Products

Surface Acoustic Wave Technology provides performance advantages and design flexibility that has proven to be invaluable to engineers in need of reliable, reproducible components featuring linear phase, temperature stability, small size, low shape factor and excellent rejection. Increasingly, SAW technology is meeting the exacting requirements of modern systems with high performance resonators, resonator filters, oscillators, and other state-of-the-art signal processing components such as pulse compressors, delay lines, and bandpass filter products. In addition to this broad product line, Sawtek provides the total engineering support needed to make the proper design trade-offs among key parameters in order to achieve the optimum performance available from SAW technology.

Sawtek produces hundreds of standard SAW products for both low and high volume programs in Cable Television, Satellite Communications, Modems, Radar, EW, and many other signal processing applications. In addition, Sawtek's custom design capability can provide technical assistance and rapid response to new design and production requirements at frequencies from 10 MHz to more than 1 GHz. Sawtek also designs and produces custom subsystems which incorporate SAW components. These include filter banks comprised of cascaded filters packaged in a single assembly, amplifier-filter modules with adjustable gain, and SAW resonator-controlled oscillators. Some of the common SAW resonator products produced by Sawtek and their characteristics are summarized below.

SAW RESONATORS

Sawtek offers SAW resonators at fundamental frequencies from 100 MHz to more than 1000 MHz. These are high Q components which are primarily intended to be used in oscillators and are also used for both bandpass and notch filters. Sawtek resonators are inherently spur free in oscillator applications, exhibit low motional resistance, and have a pulling range comparable to a 3rd overtone bulk wave crystal. Typical values of R_S range from 15 Ω to 150 Ω and capacitance ratios are nominally 2000:1. Incorporation of special metalization improves oscillator noise performance by permitting drive levels up to +20 dBm. These quartz devices can achieve temperature stability of less than 50 PPM from 0°C to 60°C. Both one-port and two-port configurations are available.

Sawtek maintains a large inventory of pre-tooled SAW resonator crystals including many frequencies for CATV convertor applications. New designs can also be tooled rapidly to meet custom requirements. The 668 MHz resonator shown below is representative of Sawtek's low-cost standard products.

SAW OSCILLATORS

SAW resonator-controlled oscillators are currently produced by Sawtek for military and aerospace systems. Because they are able to operate at fundamentals of over 1000 MHz, SAW oscillators simplify design, reduce cost, and improve noise performance through the elimination of multiplier stages. In many applications it is also possible to achieve adequate power in one stage to directly drive a mixer and thereby eliminate the need for a buffer/amplifier stage.

Typical of the company's oscillator products is a fixed frequency, oven stabilized SAW resonator oscillator at 740 MHz. All spurious and harmonics are down 60 dB; the short-term stability is $\pm 2.5 \times 10^{-10}$ for 1.0 to 25 second averaging times and the phase noise is 120 dBc/Hz for a 2.5 kHz offset. The frequency versus temperature stability of this miniature ovenized unit is ±2 PPM from −15° to +60°C. A maximum power consumption of only 1.75 watts at −15°C ambient is achieved. Sawtek also offers assistance in oscillator design for low-cost consumer and commercial applications and is prepared to help evaluate the suitability of SAW oscillators for each new application.

SAW RESONATOR FILTERS

SAW resonator filters provide high rejection and low loss for narrowband applications requiring 0.01% to 0.25% fractional bandwidths. This family of Sawtek's resonator filters is characterized by a "new shape" in narrowband filter technology. The unique shape demonstrated in the performance photographs below arises from the combination of transversal filter and resonator characteristics: the narrowband response produced by the resonant cavity emerges from the broader passband of the input and output transducers.

Two pole versions typically exhibit from 2 dB to 5 dB insertion loss with 15 dB to 20 dB near-in rejection and 55 dB to 75 dB ultimate rejection. The two-pole 537 MHz resonator filter shown on the left below has a matched insertion loss of only 4.5 dB, 18 dB close-in rejection, and 60 dB ultimate rejection.

Rejection which is beyond the measurable range of most test instruments can be achieved by cascading these two-pole units into multipole configurations. Depending on the number of poles, this technique provides from 20 dB to 60 dB of near-in rejection, improved shape factor and reduced flyback. Insertion loss generally increases at a rate of less than 1 dB per pole for these filters. The six pole 149.3 MHz filter on the bottom right has an insertion loss of only 5.7 dB and an ultimate rejection of over 100 dB.

Sawtek's resonator filters are provided in individual two-pole stages in TO-8 and TO-5 packages and in custom modules when several of these 2 pole units are cascaded. Sawtek offers standard resonator filters and also rapid custom design.

Product reliability for Sawtek's broad range of military and commercial parts is insured by a watchful quality control program that meets even the exacting requirements of military and space applications.

STANDARD MICROPROCESSOR CRYSTALS

Electro Dynamics is America's largest manufacturer of industrial quartz crystals. We grow our own quartz bars—and then process them through to the finished product: standard or custom crystals for various markets, including the television, computer, and automotive industries. Since we control every step of the manufacturing process through vertical integration, **we can offer you the shortest lead times**—and about half the industry average!

FEATURES

- Short lead time on customs.
- "On line" engineering assistance.
- Dock-to-stock, Just In Time (JIT) programs.
- Volume production capability.

Performance in a Pinch

.12" diameter x .32" high

When you're in a space pinch for high-performance crystal filters, we've got the filters that fit. Discover how little room it takes to do a big job right.

Our crystals, monolithics, discretes, and time delay filters come in sizes tough to imagine. With specs tough to match. At prices tough to beat. And as for durability, they're just plain tough.

Besides our sub-mini tubular, we offer an HC45 package that meets or beats performance specs of similar fundamental crystal filters three times its size. We can also supply you with the industry's smallest matched filter sets.

Of course, our most important products take the form of optimum solutions to your design challenges. When what you need exists only as a problem on paper, give us a call. Or send us your specs. If the performance you require in the space you've got doesn't exist, we'll design to plug the hole in your schematic. No matter how small.

In a pinch for space?

At Sokol, we can get you out of a tight spot.

By fitting into one.

SELECTING BASIC MODEL:

1. Select "Ultra Stable" if 3 x 10^{-10}/day aging or better is required; otherwise select "High Stability".
2. Select operating temperature range required (**A, B, D** or **G** from left column under "Temperature").
3. Select frequency stability desired over temperature, this determines the oscillator. (Temperature stability improves from left to right).
4. Select desired aging rate within Series to complete basic model number.
5. Determine whether you desired a low-noise option or any characteristic which is not standard (e.g., supply voltage, output level, etc.).

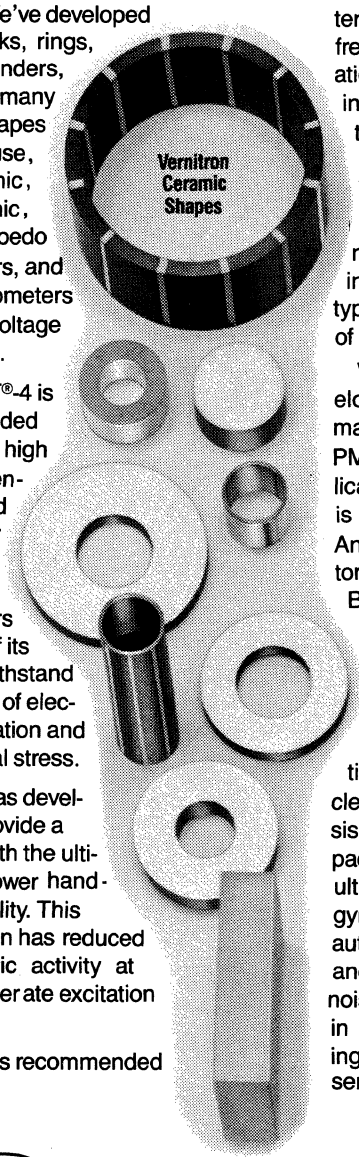
Electronic components and piezo ceramics by Vernitron. Over 45 years of innovation.

In piezo ceramics of diverse shapes. In Bimorphs and Unimorphs. Also in ceramic bandpass and ladder filters. In ceramic resonators. And in piezo igniters. That's Vernitron Piezoelectric Division.

We've been making innovations in electronic components and piezo ceramics since 1938. And we're still doing it. Take a look at some of our accomplishments in modern ceramic shapes. We've developed discs, blocks, rings, plates, cylinders, tubes and many custom shapes for sonar use, as ultrasonic, hydrophonic, and as torpedo transducers, and in accelerometers and high voltage generators.



Our PZT®-4 is recommended for use in high voltage generators and high power acoustic radiating transducers because of its ability to withstand high levels of electrical excitation and mechanical stress.

PZT-8 was developed to provide a material with the ultimate in power handling capability. This composition has reduced piezoelectric activity at low to moderate excitation levels.

PZT-5A is recommended for use in receiver or generator type transducers such as hydrophones, fuses, accelerometers, and vibration pickups in general etc., because of its high sensitivity, permittivity and time stability.

PZT-5H is better suited to low frequency applications because of increased permittivity, accompanied by a reduced Curie point.

The family of PZT-5 materials may also serve in very low power motor-type transducers because of high motion sensitivity.

Vernitron also has developed lead metaniobate materials, PMN-1 and PMN-2, for diverse applications. Their feature is higher Curie points. And we are the originators of Unimorphs and Bimorphs to serve as compact transducers for audio tones.

The above compositions are used in such applications as ultrasonic cleaners, kidney dialysis equipment, heart pacemakers, ink jets, ultrasound scanners, gyros, sonobuoys, automatic erasers and a variety of noisemakers. Also in laser positioning and as motion sensors.

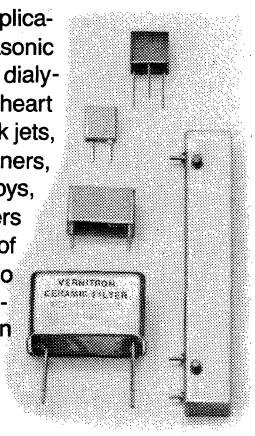
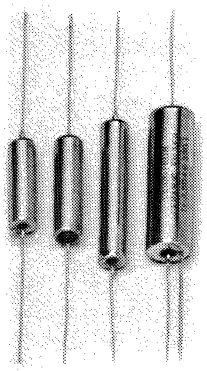
Ink Jet and Ceramic Tubes



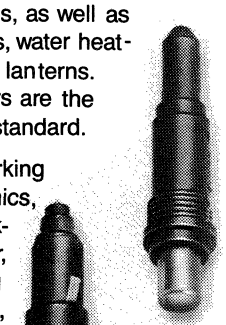
Bandpass Filters and Resonators

Innovation is also true of our work in bandpass filters, ladder filters, and ceramic resonators. We offer light weight, stable, fixed tuned, miniature ceramic filters and resonators with varieties for almost any kind of communications equipment: consumer — commercial — military.

Ceramic Ladder Filters



And don't overlook what we've done in piezo igniters for gas fired equipment of all types. Vernitron igniters are original equipment in most makes of barbeque grills, as well as in many furnaces, water heaters and camping lanterns. Vernitron igniters are the world industry standard.



So if you're working with piezo ceramics, in alarms, speakers, lasers, sonar, ink jet printing data processing, communications, telephone development, gyros, or hydrophones, pacemakers or gas-fired equipment give us a call and put our 45 years of innovation and experience — going on 46 — to work.

ADVANCED DESIGN MICROCIRCUIT CRYSTAL OSCILLATORS

XSIS microcircuit crystal oscillators are not "JUST ANOTHER CLOCK OSCILLATOR" but are hi-rel devices using a premier design that is documented to be virtually without failure. Customers call it EXPERIENCED RELIABILITY.

In house capabilities for destructive, non-destructive bond pull test, PIND test and constant monitoring of critical crystal parameters and 100% electrical temperature testing are only a few of the reasons why most major hi-rel programs using digital processing techniques use "THE-XO" (**XSIS** Oscillator).

XSIS microcircuit oscillators are manufactured to the electrical parameters of MIL-O-55310, workmanship standards are in accordance with MIL-M-38510, the quality system is as required by MIL-I-45208.

XSIS is a QPL source for microcircuit crystal oscillators to MIL-O-55310/8,/11,/14,/15,/16,/17,/18.

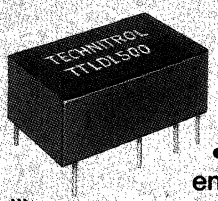
Circuit timing.

Why adjust it when you can perfect it?



Let's say you've just designed the fastest, tightest digital circuit you've ever seen. But it needs a super delay line to tie into your overall scheme. Something special. Certainly high-performance.

You need Technitrol. For leading- or trailing-edge timing of any logic-based circuit.

• Only Technitrol can give you a selection of lumped-constant active delay lines with 5 ns to 2000 ns delay times that are ±1 ns or ±1% repeatable over −55° to +125°C, at rated voltage input ±10%. That's full voltage and temperature compensation!

(We aren't just telling you they perform this well—we'll put it on the part if you wish.)

• Our programmable delay lines, up to 100k ECL, give you a selection of up to 15 different delay times per module, differing by as little as 500 ps.

• Technitrol chip-carrier delay modules enable tighter board stacking and the use of vapor-phase reflow technology.

If you're really serious about quality and performance, you'll appreciate our meticulously balanced designs that produce consistent lows and highs for both positive- and negative-going logic signals. And our low failure rates are unheard of elsewhere. Who else can give you all this?

You'll find the same performance and reliability in all of our military- and commercial-grade products. Our toughest customers demand this. You should, too.

SPIRADEL®* THE MOST COMPACT Highest Time Delay to Rise Time Ratio DISTRIBUTED DELAY LINE

FOR IMMEDIATE DELIVERY!

SPIRADEL is a small diameter, distributed constant fixed delay line, featuring higher delay to rise time ratio and excellent pulse fidelity. Its new shape offers greater package design versatility than most other delay lines available, and the entire unit is encapsulated for maximum environmental protection.

SPIRADEL covers a delay range of 20 to 6000 nanoseconds. Any delay within this range may be selected.

Time delay to rise time ratios range up to 30 to 1. Any impedance from 50 to 1000 ohms is available. Standard delay tolerance is 5%, although tighter tolerances can be held.

SPIRADEL is designed for operation from −55°C up to +105°C. Temperature coefficient over this range is 150 parts/million/°C. Bandwidth is from DC to frequency f = .35/rise time.

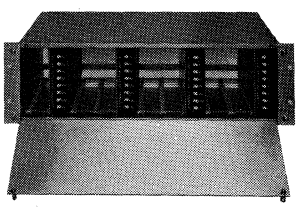
THE MOST COMPLETE LINE OF VIDEO DELAY LINES AVAILABLE FROM STOCK!

Allen Avionics, an established leader in the design and manufacture of Electromagnetic Delay Lines and L-C Filters has now developed a specialized group of products for the video market.

In color television broadcasting, accurate timing of signals is essential. This was initially achieved by the use of 75 ohm coaxial cable. The cost in time and materials to accomplish precise trimming and the lack of a rapid and convenient method of changing delays is currently responsible for the decline in cable usage. Television studios, studio equipment manufacturers and others engaged in the video industry are changing from 75 ohm cable to a more suitable method of achieving precise short delays. Allen Avionics now offers a line of Video Units for this purpose. Their use will result in a reduction of size, weight, installation cost and an overwhelming saving in time and effort to make delay changes.

Models VP0635, VP1270 and VP2075 are padded to provide a flat loss at any setting. As a result of this padding, these units will exhibit a maximum variation of ±.2db at any delay setting. **New Model VAR256** is designed specifically to provide for infinitely small delay adjustments from 0 to 256 nanoseconds. It accomplishes this by the use of a continuously variable one nanosecond delay, added to 8 additional binary toggle delays. Unlike other units on the market, this unit introduces absolutely no video distortion due to the continuously variable delay adjustment. Combine this feature with low insertion loss (less than .15dB) and you have a unit with unparalleled specifications that everyone in the video field will find very useful.

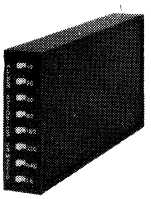
RACK MOUNTABLE UNITS



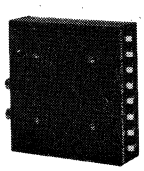
RACK MOUNT showing delay units with switches and terminals available for delay changes. Up to 11 delay units can be housed. Cards for mounting units in rack are purchased separately. Note hinged front panel.

This rack mountable series of video and pulse delay lines has the capability of replacing up to 1450 feet of cable.

Four variable slide switch units are being offered with total delays of 255, 637.5, 1275 and 2270 nanoseconds. Each unit contains 8 individual delay units. **Four strappable units** are also manufactured with total delays of 317.5, 635, 1270 and 2260 nanoseconds. The strappable units consist of 7 separate delay lines each having their own input and output terminals. The slide switches or terminal strapping provide methods for adding the individual lines together so that the output is always the summation of the individual lines. This eliminates most video distortions and assures good chrominance to luminance delay. Precision delay changes of as small as one nanosecond are easily accomplished. Low insertion loss, amplitude and delay flatness, along with excellent pulse fidelity, are characteristic of this series.



Showing 8 individual slide switches for rapid delay changes.



Units are rack mounted by attaching a durable plastic card to the large surface.

All units are manufactured to fit standard 19 inch racks and are provided with additional inserts to satisfy almost any mounting requirement. Delay units and racks can be purchased separately. The rack is manufactured with a hinged panel so that fast delay adjustments can be made. However, once adjustments are made, the front panel prevents further tampering with the slide switches or terminals.

These new delay units feature extremely flat amplitude response to 5.5 MHz, small increments of delay variation, low signal distortion and tight delay tolerance. The delay networks are ideal for pulse applications because of their fast rise times and low distortion. Amplitude equalization is employed to achieve excellent flatness over the video frequency range. The delayed output of any model in this group is the summation of individual lines. It is not the result of a tapped line. This feature insures that output pulse distortions are minimized. Units will match to any 75 ohm system and can be directly connected into the video signal path by means of BNC connectors.

ATTN. COMMUNICATION FIELD: VARIABLE DELAY FOR RADIO PAGING

In recent years, the communication industries have directed a good deal of attention to the development of devices suitable for delay correction of signals sent to remote transmitters. Paging systems use this form of delay correction and are one of the popular fields to employ these delay units.

"LC DIP" THE WORLD'S SMALLEST DUAL-IN-LINE 14 PIN TAPPED LUMPED CONSTANT DELAY LINE

The "LC DIP" represents the smallest delay line currently available. It is a lumped constant delay line offering the ultimate in high density packaging and tapping capabilities.

These units are excellent for high frequency applications. The availability of 10 equal delay increments and the dual-in-line packaging along with its low silhouette make for compatibility with semiconductor and other assemblies where circuit board height must be held to a minimum. The foregoing makes the "LC DIP" extremely adaptable for the computer and allied industries.

SERIES "HF", "HR" & "VHR" LUMPED CONSTANT DELAY LINES

HIGHEST TIME DELAY / RISE TIME RATIO EVER BUILT!

These Delay Lines have the highest ratio of time delay to rise time that has ever been built in a Lumped Constant Line. Unlike other types of high ratio lines, the Lumped Constant Delay Line has a passband from D.C. to its cutoff frequency and maintains a constant delay over these frequencies. These lines are also unique in that they offer relatively low insertion loss. The units are characterized by tight time delay tolerances, low pulse distortion, excellent phase linearity and good temperature stability.

To calculate rise time in microseconds, divide the ratio into the delay. To calculate bandwidth, divide rise time in microseconds into .36. Answer will be in MHz. Attenuation range 9 to 20db.

"HF"

50/1 RATIO
Delay Range .25 to 10 microseconds.

14 PIN - 5 TAP

TECHNICAL INFORMATION

Bel Fuse Digital Delay Lines Series 0447 features five equally tapped delay lines with total delays of 25 to 500 nanoseconds. The lines are compatible with TTL and DTL circuits. Either Logic "1" or Logic "0" inputs are accepted. Cascading of units causes no undesirable reflections. The reduced dimensions, with standard Dip Pin-Out permits dense packaging on your circuit board.
Special designs upon request.

SERIES 0458—DIGITAL DELAY OSCILLATOR

This day oscillator works as an asynchronous start-stop free running clock pulse generator. The oscillator is intended as the primary control element of state machines used in digital controllers. The assertion of the input (high) trigger causes the oscillator to free run, producing TR thru T4 clock pulses for as long as the input is asserted. Oscillation ceases when the input trigger is negated.

SERIES 0455 DRAM DELAY LINES

System performance specifications are improved dramatically in the NEW Bel Fuse series of DRAM delay lines which integrate the standard delay line and miscellaneous gating into a single part. ALL Timing pulses required to access the DRAM are generated internally thus minimizing the tolerances on the critical timing edges. Since access time is directly related to the row/column multiplex switching time, this ram timer series generates all timing edges required by this sequence in addition to providing auxiliary timing for latching read data. These pulses may also be used to guarantee other RAM timing such as the hold time of RAS relative to CAS.

The applications of these lines are for both the small and the large system users. Users of systems requiring only a single row of rams will find the 01 series satisfactory, while users of larger systems who need to support multiple rows of rams will require the 02 series. Using a suitable, externally generated RAS signal, the ram delay will then generate all appropriate timing signals referenced to ras, for accessing the ram.

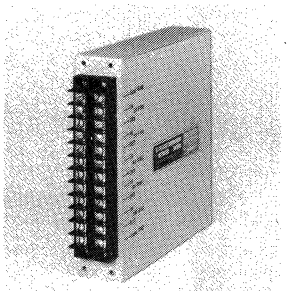
NOTES
1. Continuously variable output, high impedance tap.
2. Variable output via a coarse control 10 steps of 0.4 μsec and a fine control of 10 steps of .045 μsec.
3. Delay adjustment programmable by remote control.
4. Variable output via discrete screw driver slotted switches.
5. No high impedance tap necessary.

PRECISION AUDIO DELAY LINES



Over the years Control Electronics has developed a special skill in precise audio delay lines, including sectional balanced and unbalanced units ranging into the millisecond region. The sectional line terminals are arranged so as to conveniently enable the user to externally connect and disconnect the various sections for proper delay.

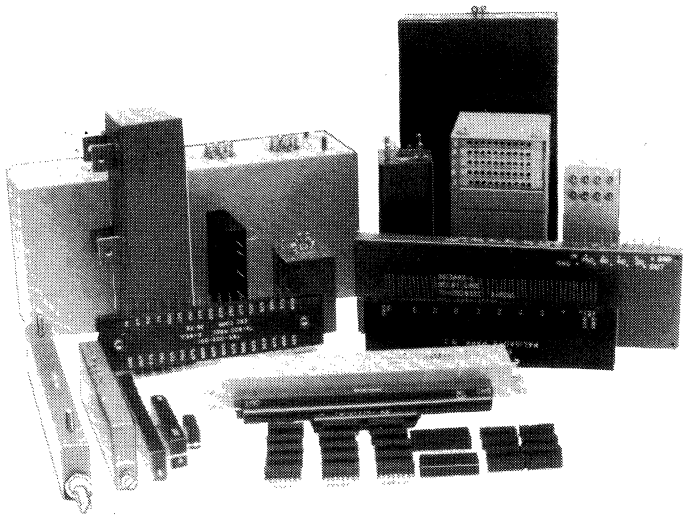
DELAY LINES

OVER 30 YEARS OF SUPERIOR QUALITY AND RELIABILITY!

30 years of experience and expertise in delay line design and manufacture. The following pages list a large sampling of the industry's current demand for short delay lines both analog and digital types, but ESC is still the most chosen source for delay lines ranging up to several hundred milliseconds and with delay-to-rise time ratios up to 250:1. In addition to lumped constant types, also manufactured are distributed constant, voltage variables and mechanically variable devices.



ESC ALSO DESIGNS AND MANUFACTURES TYPICALLY:

Equalized, Precision tapped, low distortion, beam forming delay lines for sonars, scanners, transponders, sorters, Tacan and DME, etc.

Programmable and mechanically variable Delay lines for the TV Broadcast industry, including video cable simulators and voltage variable Delay Lines.

Proven design, manufacturing capabilities, and facilities encompassing all quality levels dictated by MIL-I-45208 and MIL-Q-9858A.

HIGH RELIABILITY:

The proven design and manufacturing techniques are employed by ESC for all levels of reliability required for the military, satellite or space probes and encompass quality levels dictated by MIL-I-45208 & MIL-Q-9858A as applicable.

ESC has participated in many hi-rel programs over the years starting with Apollo, Minuteman and the Viking Probe and currently in such programs as Trident, F15, F16, B-1, Space Shuttle and Peacekeeper.

ESC maintains an extensive continuous program of life testing on the new generation of military TTL compatible hybrid delay lines. This program has accumulated data indicating exceptionally high reliability for both commercial and military applications.

ESC has expanded its testing capabilities for the new generation of TTL,DTL & ECL Compatible hybrid delay lines. Testing is accomplished by computer controlled, state-of-the-art equipment, which is capable of recording leading and trailing edge delay time, rise and fall time, all within seconds. In addition and at comparable speeds, the hybrid delay line DC parameters such as Icc,Vi,Vol,Voh,Ii,Iil and Iin are swiftly measured and recorded if necessary.

The highly accurate and high speed testing system allows all parameters to be tested on a 100% basis guaranteeing the highest quality product to our customers.

At the side is a sample computer read-out exhibiting the leading and trailing edge delay and rise and fall times at three operating levels for a TTL hybrid delay line.

CUSTOM MINIATURE & PRECISION DELAY LINES...

Optimization of Most Critical Parameters as Required.

Over the past two decades, **Kappa** has optimized, packaged, and critically tested literally thousands of specific variations of several hundred different passive and hybrid delay lines: fixed tapped, continuously adjustable, and electrically trimmable (varactor-tuned) lines; over virtually the complete signal spectrum from control (subaudio), through audio, sonar, RF, HF, and a wide variety of pulse rates widths and duty cycles.

Typical design families include:

- PRECISION SONAR DELAY LINES (Series A) 500 μsec to 10^6 μsec ±1%; linear to ±0.05%
- LOW-DISTORTION LINES (Series D) Delay-to-Rise-time Ratio: 50 max.; Bandwidth: 50 MHz max.
- MINIATURE CONTINUOUSLY VARIABLE DELAY TRIMMERS (Series TT) Size: ¼ Cubic Inch; up to 120 ns; resolution ≤0.25 ns.
- SUPER-η^{TM} DELAY LINES (Series H) Embody New Design Principle Providing the Highest Efficiency Yet Obtainable in Lumped-Constant Delay lines.
- MINITRIM DELAY LINE (Series MT) Resolution Less Than .5 ns and Delay Ranges Up to 300 ns.
- VIDEO BROADCASTING DELAY LINES (Series BC) Widely Used in the Most Demanding Color TV Applications in American and European Systems

ALL NEW with this edition of EEM

GET ORGANIZED!

Are your catalog files organized? Can you find any given catalog in a matter of seconds? If your answer is "Yes," you probably already have the EEM File System. But, if you said "No," you really ought to look into this simple system. It will save hours of time and tons of aggravation.

The EEM File System was invented over twenty-five years ago to help people who specify, buy, or work with electronic products and equipment. It is upgraded on a constant basis to reflect the current state of the art. It's easy to use and easy to customize to your particular needs.

You say you want to file catalogs by type of product? That's easy to do with The System. But, what are you going to do when there are multiple products in one catalog? Take Mallory for example. There are all kinds of products in the Mallory Short Form Catalog. With the EEM File System all you do is file the catalog under "M" for Mallory and refer to it on all of the cross reference cards that apply.

There are thousands of EEM File Systems in everyday use in engineering and procurement offices all over the world. Shouldn't you be using this proven system?

The EEM File System is shipped in one neat package. The package contains everything you need to set up your very own filing system. Best of all, it's easy to get and very affordable. Send a check or money order for $25.00 and EEM will pay the postage and sales tax. If you must use a purchase order, please add $5.00 for postage and handling. An invoice will accompany your System.

Don't waste any more time. Get organized now!

Technitrol delay-module performance is widely known and highly regarded by both military and commercial users. Many models, such as the ultrastable STTLDL shown below, are unmatched in performance and reliability. Designed primarily for high-performance applications, the STTLDL has very high output stability over a wide range of temperature and input-voltage variations. Increasingly, the STTLDL is selected as a commercial prototype for brand-new designs — and then written in because of the superior performance it offers.

We invite you to consider the STTLDL as an example of Technitrol capability. Its technology is an integral part of all our delay modules — including low-cost products — shown on this and the following pages.

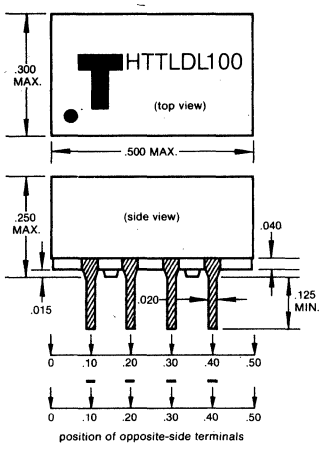
HALF-DIP HTTL PACKAGE

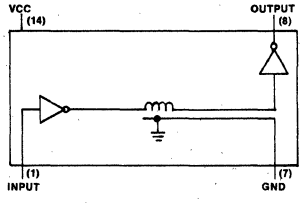


TECHNITROL TTL DELAY MODULES

Technitrol TTL delay modules are designed to be used directly with super-high-speed TTL, standard TTL, and DTL logic circuits. They interface with little or no additional requirements. They can be cascaded in various combinations to get any delay without degrading output rise time (T_R+ or T_R−). The delay rise-time ratio (T_D/T_R) of individual modules is very high (approximately 50:1) and improves with cascading modules. Output rise times of each module are independent of input rise times up to 50 ns. All Technitrol delay modules are transfer molded, not potted, assuring maximum reliable operating lives.

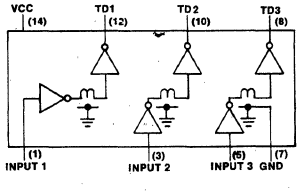
SINGLE-OUTPUT DELAY MODULES

Single-output modules are available with 5 to 500 ns delays. Buffered. Only the pins to be used are brought out.



TRIPLE-OUTPUT DELAY MODULES

Technitrol TTL buffered delay modules are available with three individual inputs and outputs in delays from 5 to 250 ns per delay.



10-TAP DELAY MODULES

10-tap delay modules are available with 50 to 500 ns total delays. Dimensions same as standard 5-tap, with the exception of 5 additional pins. See connection diagram.

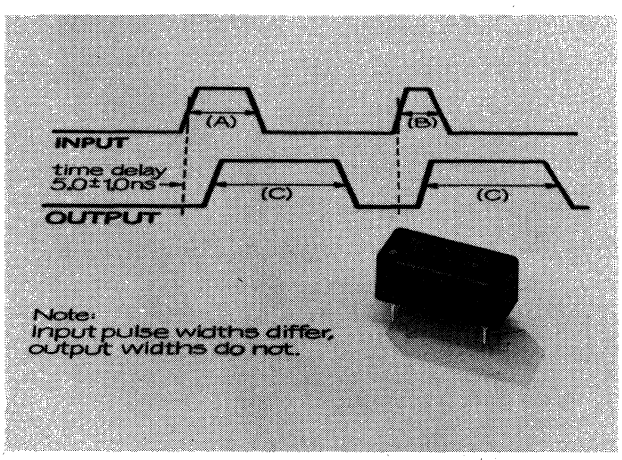
NEW TTL PULSE-WIDTH REGULATORS

A new concept. Takes TTL-level input signals of unequal duration and transforms these into TTL-level output signals of precisely timed and equal duration. Can replace a monostable multivibrator, and provide improved output stability.

5 ns minimum input-pulse width. 5 to 500 ns output-pulse width, as selected. Input-pulse width can vary; output-pulse width remains the same. Precisely timed output-pulse trailing edge permits trailing-edge timing or gating functions.



- 5 ns propagation delay from input to output.
- −55 to +125°C temperature range available.
- For Schottky TTL, TTL, and low-power Schottky TTL circuits.
- ±10% supply voltage tolerance.
- Minimum input-pulse width only 5 ns.
- Pin compatible with 74/54 series TTL/SSI 14-pin DIP.

NETWORKS

RANDOM NOISE MEASUREMENT NETWORKS (EIA STANDARD RS-250B)

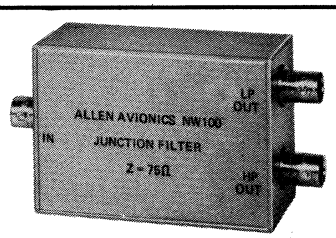
Most of the video industry has found a need for passive networks designed for use in making noise measurements in a 75 ohm system. Allen Avionics now manufactures three passive networks for noise measurement. They include:

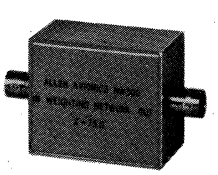
1) A Junction Filter to cut-off all frequencies below 10 KHz
2) A Lowpass Filter to cut-off all frequencies above 5 MHz
3) A Weighting Network to shape the passband

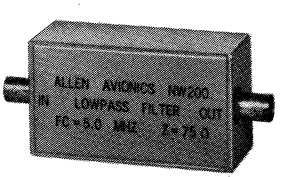
IMPEDANCE 75 OHMS

Part No.	Description	Size
NW100	Junction Filter	3″ x 2″ x 1¼″
NW200	5 MHz Lowpass Filter	3″ x 1⅝″ x 1⅛″
NW300	Weighting Network	2″ x 1⅝″ x 1⅛″

UNITS SUPPLIED IN METAL CANS WITH BNC CONNECTORS







PRE-EMPHASIS & DE-EMPHASIS WAVE SHAPING NETWORKS

Pre-emphasis networks are used preceding the FM modulator in order to optimize the TV transmission.

De-emphasis follows the demodulator and serves to restore the wave shape of the demodulated signal.

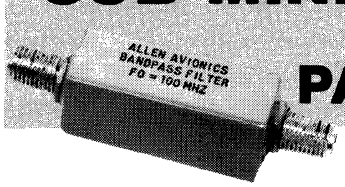
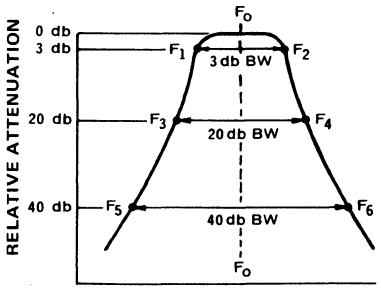
SUB-MINIATURE BANDPASS FILTERS
FROM 10MHz to 500MHz
PASSIVE L-C FILTER DESIGN
50 Ohms — 1db Maximum Ripple



All of our filters are specified as having a minimum bandwidth at the −3db points and a maximum bandwidth at the −20 and −40db points. These filters are no exception. Most of the bandpass filters on this page do not exhibit arithmetic or geometric symmetry. However, to insure our customers of a simple method of determining their requirements, we are specifying the −3db, −20db and −40db bandwidths as if all had arithmetic symmetry. This will guarantee that at least ½ of the 3db passband will exist on each side of the center frequency. The −20db and −40db points will be no greater than ± ½ of their respective bandwidth away from the center frequency.



F_1 to F_o and F_o to $F_2 > ½$ 3db bandwidth
F_3 to F_o and F_o to $F_4 < ½$ 20db bandwidth
F_5 to F_o and F_o to $F_6 < ½$ 40db bandwidth

ORDERING PROCEDURE

Filter Type	Center Frequency (F_o)	3db Bandwidth (F_c)=$\frac{F_o}{Q}$	Shape Factor (See Table)	S (for SMA Connectors) *p (for Printed Circuit Mtg.)
	Can be any 3 digit number from 10 to 500MHz. "P" represents decimal point and must be used in 2nd, 3rd or 4th location.	Can be any 3 digit number up to 125MHz (a center frequency of 500MHz with a Q of 4). "P" represents decimal point & must be used in one of the 4 locations. The specified bandwidth must be within the limits of the tabulated Q. (See examples below.)		

EXAMPLE: MB − 99P5 − 4P50 − A − S

This Part No. describes a bandpass filter having its center frequency at 99.5MHz and having a 3db bandwidth of 4.50MHz with an "A" shape factor and SMA Connectors. Note in tabulation below that for a center frequency of 100MHz, and a shape factor of "A", a Q of up to 30 is realizable.

EXAMPLE: MB − 10P0 − P200 − A − S

This Part No. describes a bandpass filter having its center frequency at 10.0MHz and having a 3db bandwidth of .200MHz with an "A" shape factor and SMA Connectors. Note in tabulation below that for a center frequency of 10MHz, and a shape factor of "A", a Q of 50 is realizable.

*PC Mounting optional for center frequencies of 100MHz or less.

SHARP DELAY EQUALIZED LOWPASS FILTERS

By the utilization of delay equalization techniques, Allen Avionics now designs and manufactures a complete line of sharper cut-off, flat delay lowpass filters than shown above. We offer these with 40db to 3db ratios as small as 1.22 and delay distortion of less than 10%.

VIDEO FILTERS

DELAY EQUALIZED NTSC LOWPASS FILTERS — VFL, MVFL & VCL SERIES

For the video field, we have built many lowpass filters having sharp roll-offs and good passband delay linearity with cut-off frequencies from .1 MHz to 10 MHz. The most popular of these are used to attenuate the harmonics of the NTSC color sub-carrier frequency 3.58 MHz. The most commonly used filters in this group are tabulated below:

VFL & MVFL SERIES — IMPEDANCE = 75 OHMS

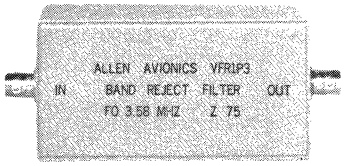
NTSC REJECT FILTERS

Some of the most frequent specifications that we encounter in the video industry are based upon rejection of the color information in the video signal to provide isolation from the luminance signal. These specifications require very low phase distortion to the luminance signal. To satisfy this requirement, Allen Avionics has designed a group of band reject filters with phase equalization where necessary. One of the most often used applications for this band reject filter is in color systems for monochrome transmission to prevent color flashes from appearing on the screen. Since various segments of the television industry have different passband requirements, we are listing three filters with different reject bandwidths.



Impedance = 75 ohms.
Maximum Insertion Loss @ 100 KHz = 3 db.
Maximum Passband Ripple to 5.5 MHz = ±.25 db.

Part No.	Maximum 3 db Attenuation @ Frequency (MHz)	Minimum Attenuation @ 3.58 MHz
VFR4P6	1.95 — 6.55	40 db
VFR1P3	3.00 — 4.30	40 db
VFR0P5	3.37 — 3.88	30 db

NTSC BANDWIDTH FILTER

Allen Avionics sub-carrier bandpass filter is a low distortion unit designed to attenuate the luminance information in color TV signals. This filter is useful in most applications where it is required to isolate the chrominance information.

Impedance = 75 ohms.
Maximum Insertion Loss @ 3.58 MHz = 1.5 db.
Maximum Ripple = ±.25 db.

Part No.	Maximum 3 db Attenuation @ Frequency (MHz)	Minimum 30 db Attenuation @ Frequency (MHz)
VFB3P6	3.40 — 3.70	2.40 — 5.80

Size: 4″ x 2″ x 1¼″ in metal can with BNC Connectors.

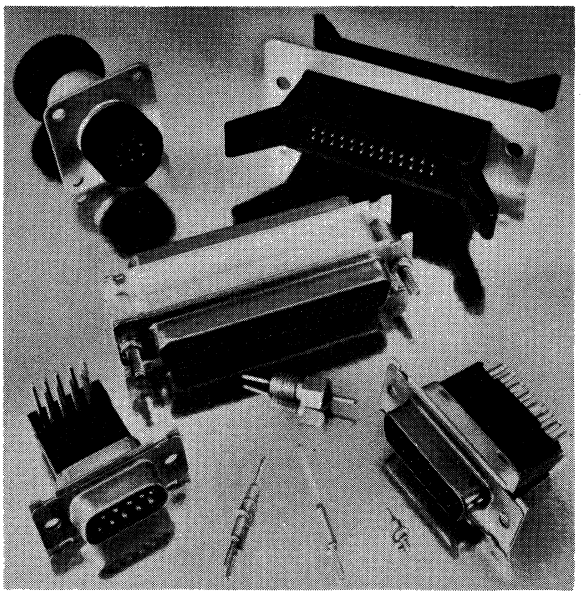
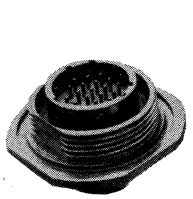
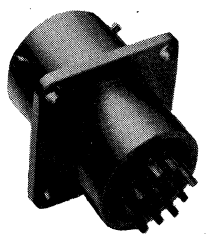
AMP Makes the Difference in Filters







All the above connectors are available in filtered version.

Proven, Inexpensive Filtering. AMP Quiet Line Filters provide proven, inexpensive filtering of conducted electro-magnetic interference (EMI) and general system noise. Available as loose pieces or as components of preassembled connectors, AMP Quiet Line Filters are divided into Standard and Premium groups. Standard series filters are appropriate for most commercial applications. Generally, Premium series filters offer higher operating voltage maximums, withstand higher operating temperatures and provide higher dielectric withstanding voltage and insulation resistance. Also, Premium series filters are subjected to environmental testing typical of components for military applications.

Standard and Premium filter groups are divided as follows: Within the Standard group there are three series having normal capacitance (20, 30 and 50 series having 1000, 2000 and 3000 picofarads min., respectively). Within the Premium group there are three series having normal capacitance (20P, 30P and 50P series having 1500, 3000 and 4000 picofarads min., respectively).

Standard mid-capacitance filters are divided into two series: The 90 series having 600 picofarads max. and the 100 series having 1000 picofarads max.
